TALK OUTLINE

1) Introduction

- a) Evolutionary framework
- b) Origin and diversification
- c) The dog as a model species
- d) The canine genome and canmap projects

2) How to engineer and genotype-phenotype map a dog

- a) Three ways to build a dog
- b) Association and selective sweep mapping
- c) IGF1, the body size gene
- d) Legs and fur
- e) The number of genes
- f) Evolving the dog

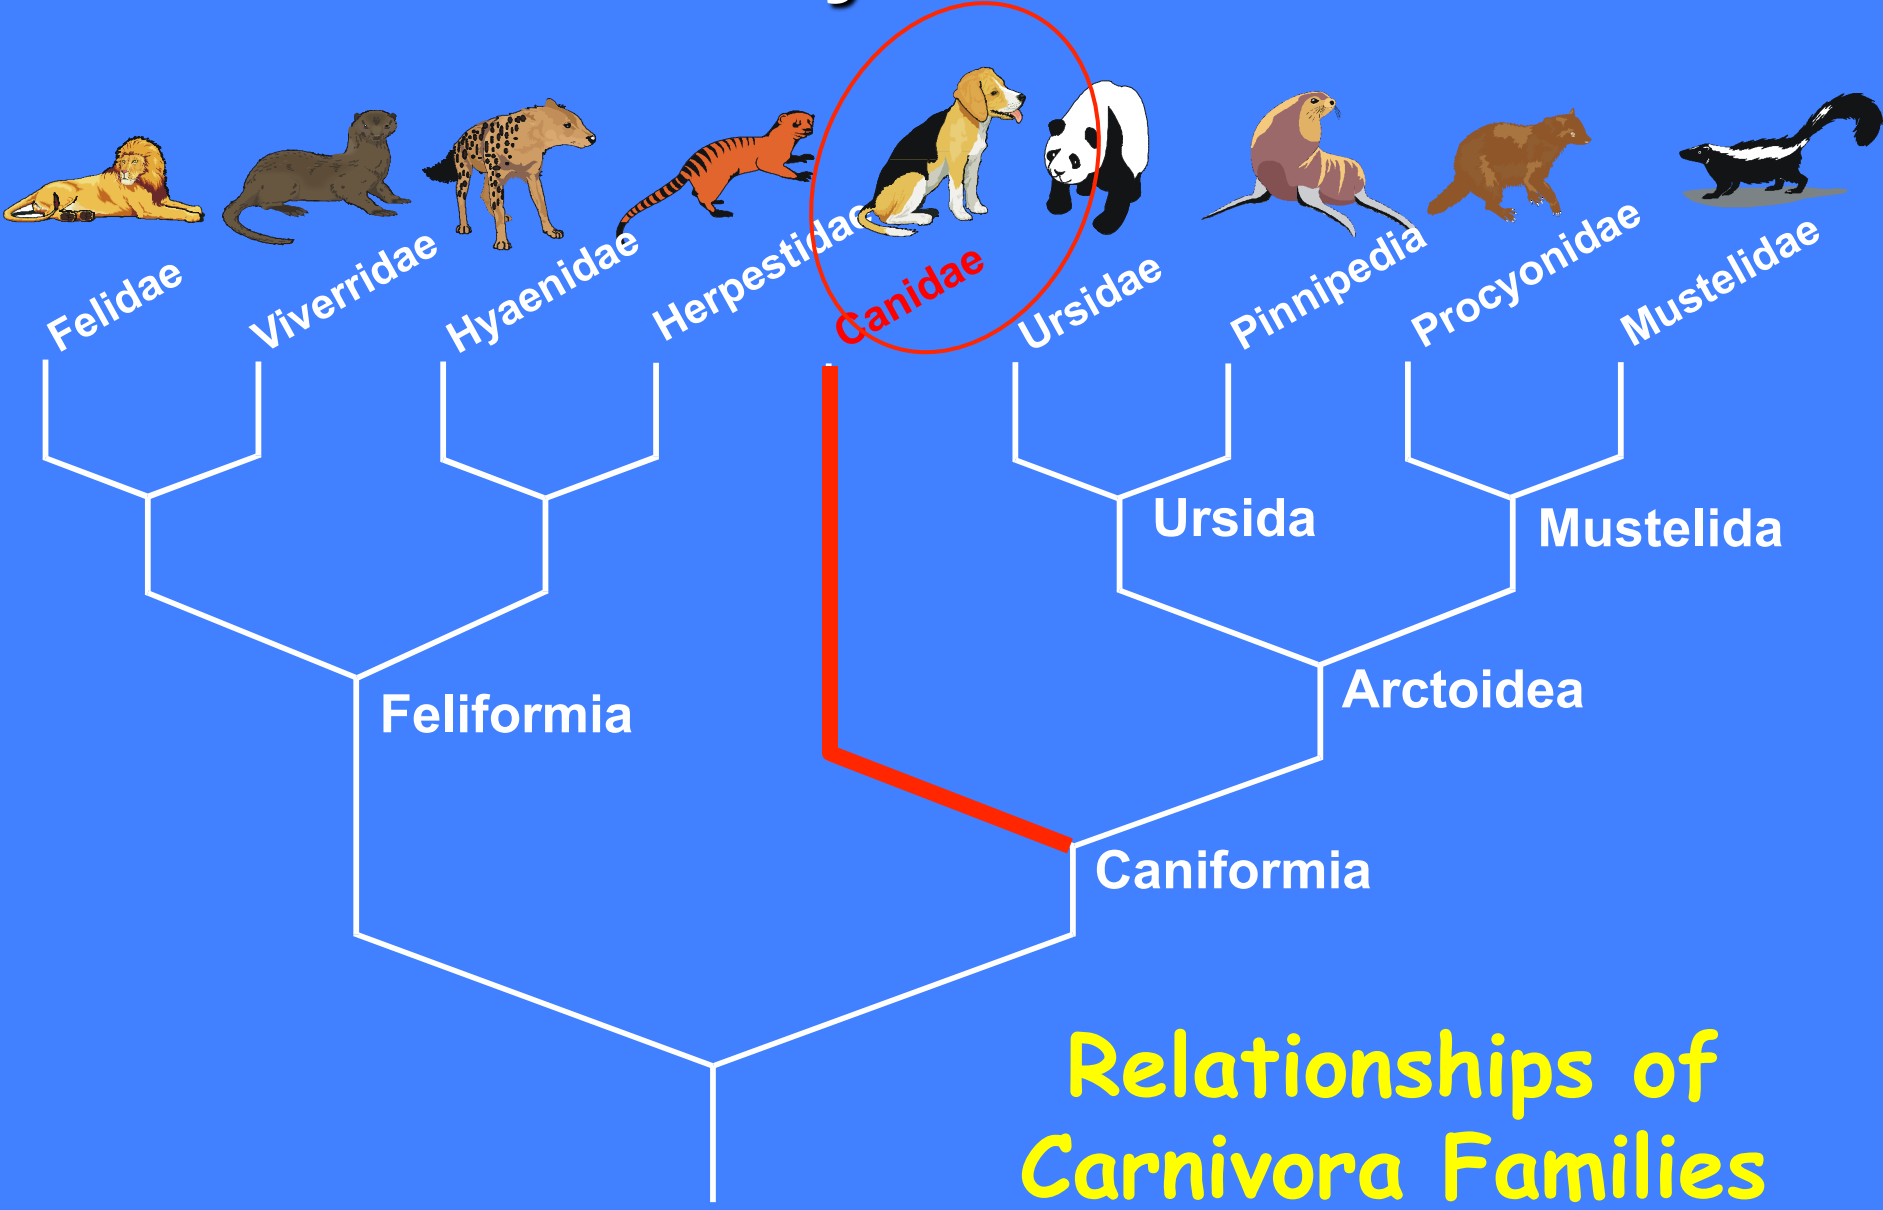

3) Engineering in the Wild

- a) Black and gray coat colors of wolves

4) The future

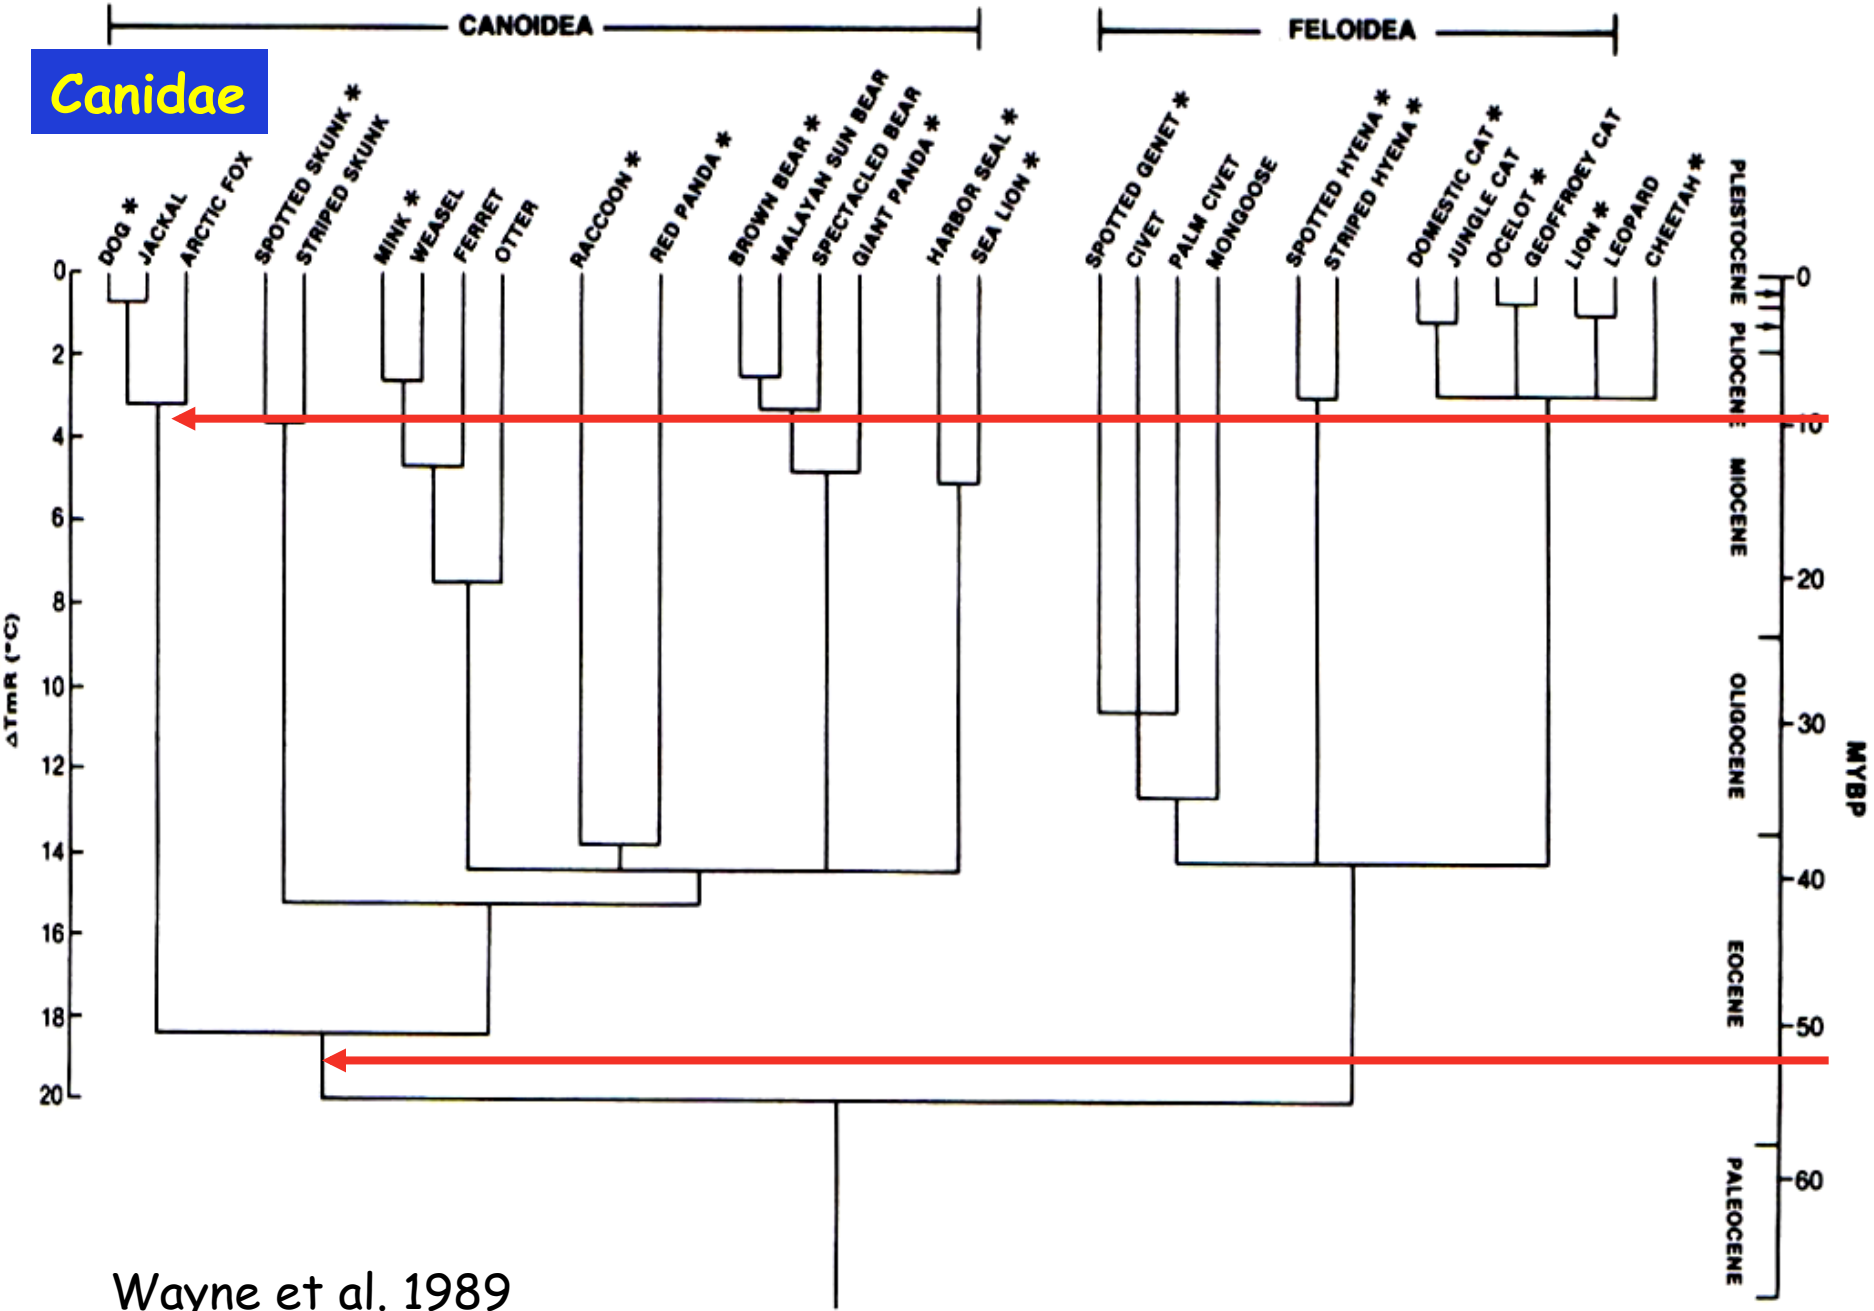

- a) Exome capture and complete genome sequencing

a. The evolutionary framework

Relationships of Carnivora Families

Canidae

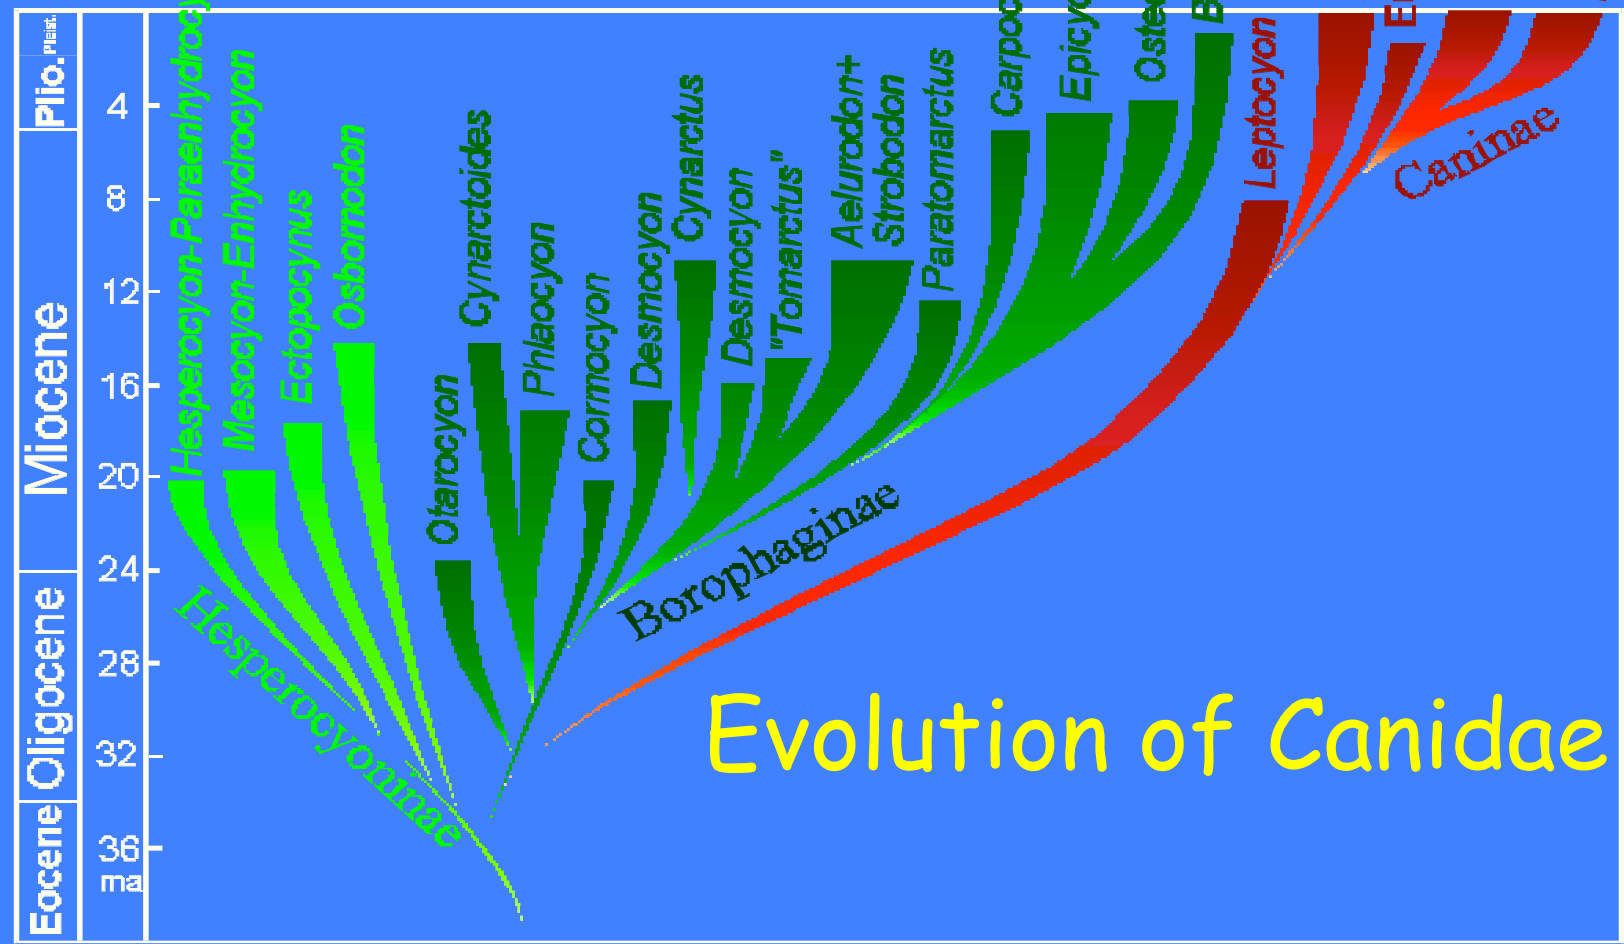

Wayne et al. 1989

Borophaginae

Caninae

Hesperocyoninae

Lindblad-Toh et al., Nature, 2005

CONCLUSIONS

- 1) The dog has an ancient divergence from other carnivores dating to about 55 million years ago.
- 2) The extant Canidae has a relatively recent origin about 10 million years ago and is divided into three primary groupings. The dog is assigned to the wolf-like group.
- 3) The dog is extremely close to gray wolves and shows no evidence of origin from other wolf-like canids.

CONCLUSIONS

- 1) The dog has high mitochondrial DNA sequence diversity suggesting a diverse origin from multiple wolf matrines from a wide region.
- 2) However, the higher diversity of dog mtDNA in East Asia suggest that dogs may have had a long history there.
- 3) Dogs are the oldest domesticated animals, originating 15-100,000 years ago.
- 4) Neoteny has been a common mode of change, affecting behavior and morphology.

Questions

- 1) The reason dogs appear to have evolved in East Asia is based on:
 - a. The fossil record
 - b. Historical record
 - c. Morphological studies
 - d. Higher mtDNA diversity
 - e. Lower mtDNA diversity

- 2) The apparent phenotypic diversity in skull shape in dogs as compared to cats reflects what general difference between the two species:
 - a. Selection for bite strength
 - b. Selection for bigger brain size
 - c. Occlusal and breathing limitations
 - d. Differences in developmental gradients

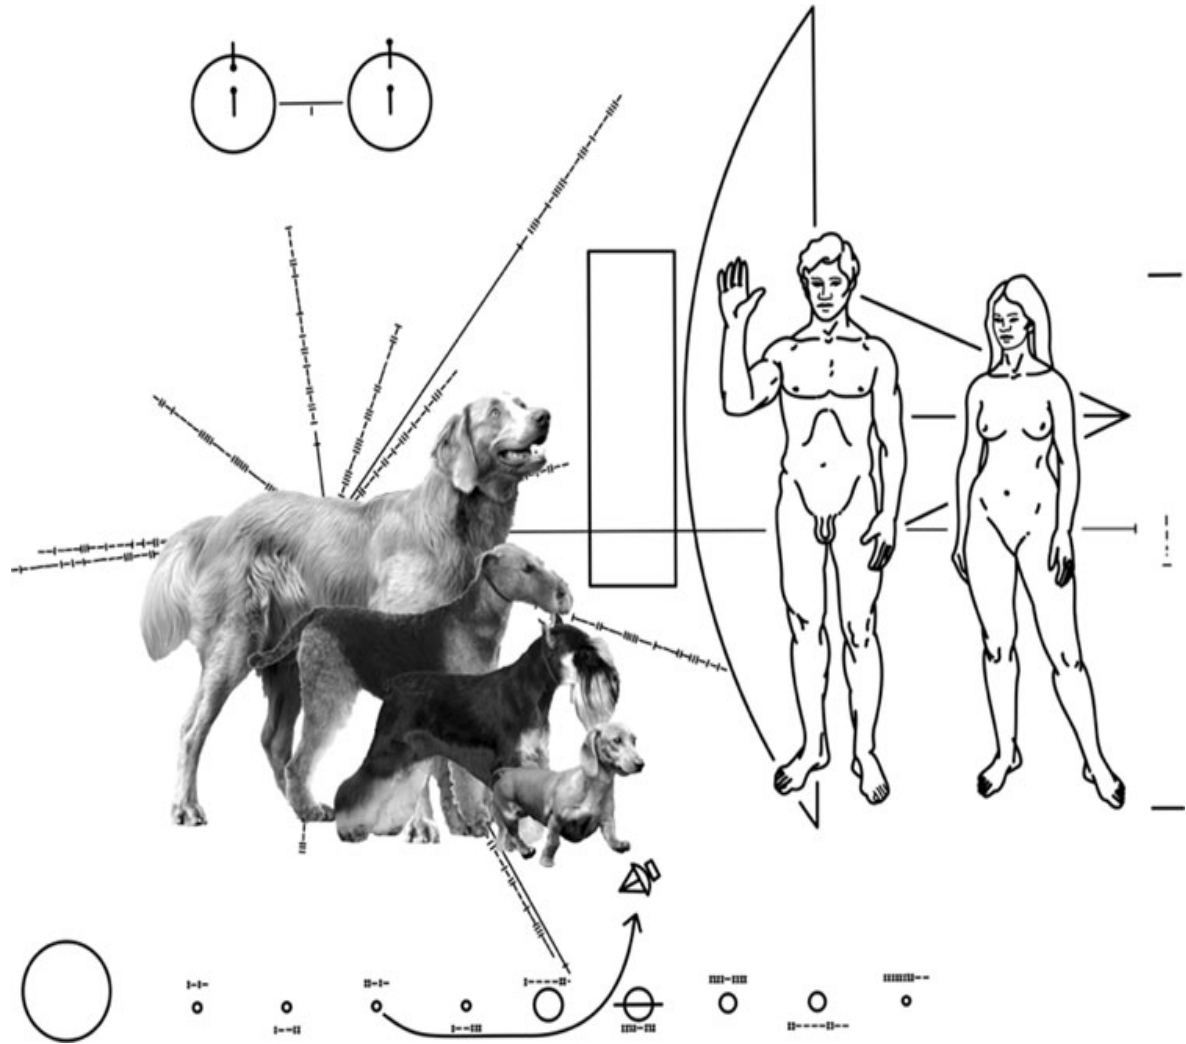

- 3) The dog is derived from:
 - a. an extinct species
 - b. a diversity of wolf-like species
 - c. gray wolves
 - d. none of the above

C. The Dog as a Novel Model Species

- Each breed fixed for specific traits
- Creation of breeds recent and rapid
 - Closed breeding
 - Popular sires
 - Population bottlenecks
- Small number of genes responsible for many complex traits

Fig. 1 Dog breed diversity helps to cure humans. The photo of four dog breeds, meant to represent canine diversity, is superimposed on the famous pictorial message sent on the Pioneer 10 spacecraft. The Pioneer plaque shows a man and a woman, a hyperfine transition of neutral hydrogen (*circles top left*), the relative position of the Sun with respect to the center of the galaxy and 14 pulsars (*lines*), the solar system (*circles bottom*), and silhouette of the spacecraft. It aimed to represent how the human species portrays itself and its place in the galaxy

D. The Sequencing of the Dog

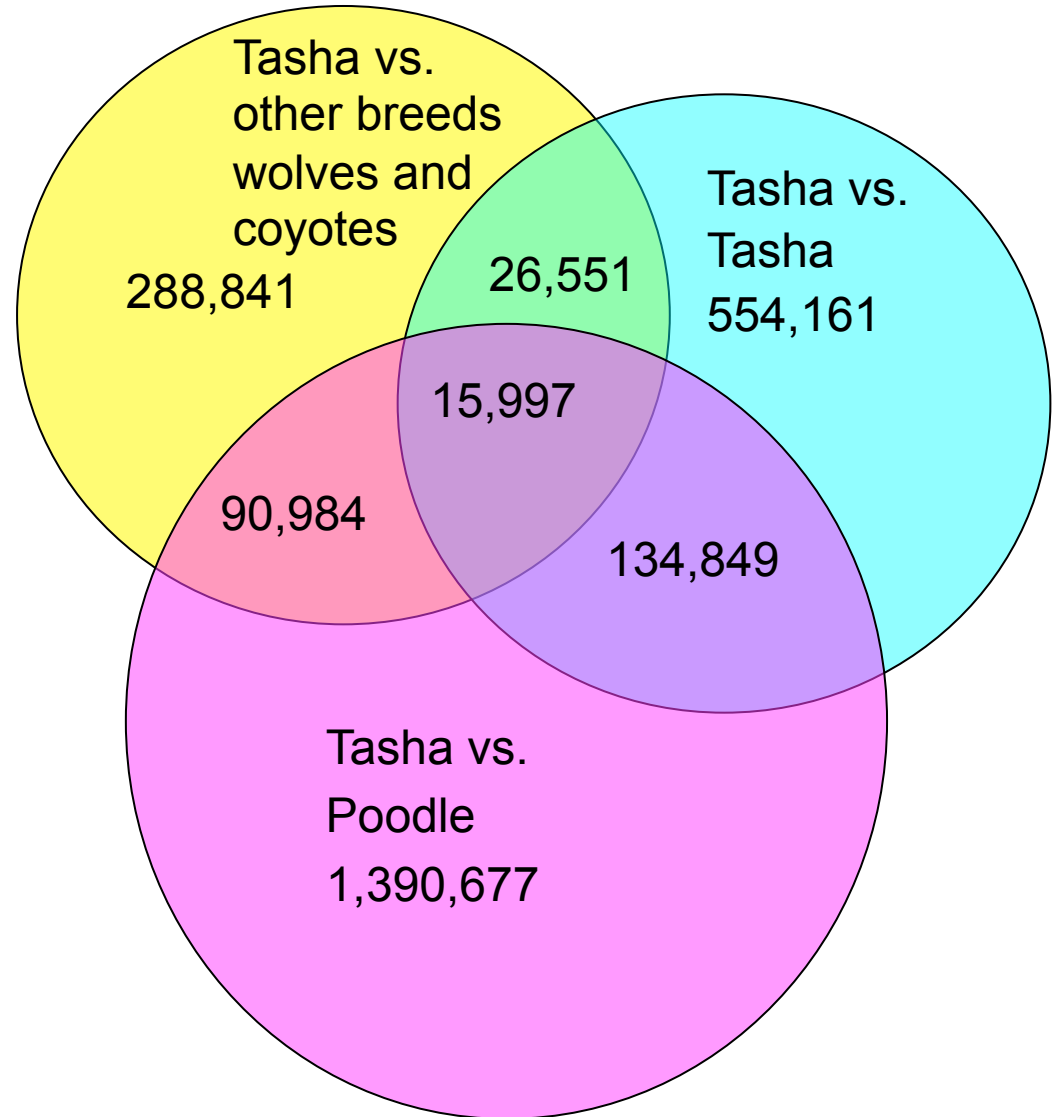

Dog Genome Resources

- Complete genome sequenced - 2.4 Gb
- Boxer - 7.5X coverage (Linblad-Toh et al., Nature, 2005)
- Poodle - 1.5X coverage (Kirkness et al., Science 2004)
- 19,120 Dog genes predicted, nearly all with human homologs
- 2.1-2.6 Million SNPs generated from Boxer and Poodle complete genomes, 10 other dog breeds (100,000 sequence reads each), and 4 wolves and one coyote (20,000 sequence reads each)
- 127,000 Dog SNP microarray chip
- Searchable annotated genome (e.g. UCSC Genome Browser, Ensembl) e.g. allows identification of new microsatellite or SNP loci in regions of interest
- Syntenic map of Dog, Human, Mouse, Rat
- Cost: 46 million dollars

The Dog Genome Project

2.6 Million SNPs Total-SNP Every 5 Kb

E. The CanMap Project

(like the human hapmap project aims to characterize genomic variation)

- CanMap Project:
 - Dr. Elaine Ostrander (NHGRI/NIH - CGB)
 - Dr. Robert Wayne (UCLA EEB)
 - Dr. Carlos Bustamante (Cornell/Stanford)
 - Affymetrix and Michele Cargill
- 127,000 SNPs (all Perfect Match oligos)
 - Magic genotyping algorithm- 50-70K
- Quality assessment for standardizing across batch
- Excluding SNPs:
 - When sample call rate is $< 95\%$
 - When SNP MAF $< 1\%$
 - When SNP heterozygosity $> 60\%$

Samples

Collect DNA from 5-10 unrelated dogs from 85 breeds and gray wolves (the ancestor of dogs)

The Canine SNP genotyping microarray

The CanMap Project

Mapping Genes Underlying Phenotypic Diversity among Domestic Dog Breeds

About

Genetic Diversity

Breed History

Phenotypes

Software

Upload data for Analysis

The domestic dog is a phenotypically diverse species in which discrete phenotypes segregate along breed boundaries. We aim to characterize genetic variation in the domestic dog and identify genomic regions associated with skeletal and coat color differences among dog breeds. Our research design consists of three distinct components:

- (1) A genome-wide survey of SNP variation.
- (2) Screening the dog genome for footprints of selection.
- (3) Genome-wide association mapping of breed-specific traits.

2. How to build a dog

2. How to build a dog

B. IGF1, the body size gene

A General Approach For Finding Genes Under

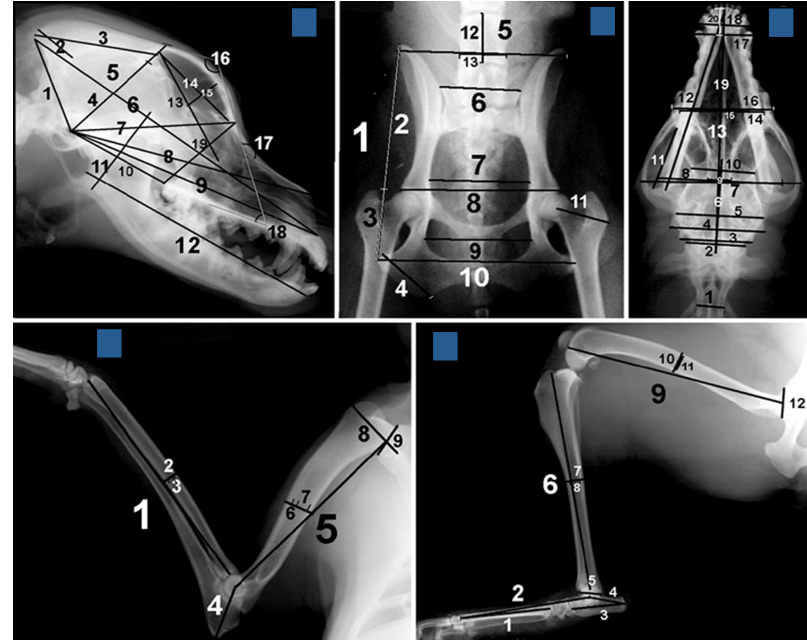

- First (Polymorphic) causal variants
- Second (Association) dog mutations

reed
rphs to find
ns containing
p and
and small
e causative

Step 1: Genome-wide scan

Genotype, Measure Skeletal Phenotypes, and Do Principal Component Analysis

- Focus on the Portuguese water dogs that have small and large morphs
- Genotype 500+ pedigreed dogs at 500 microsatellite markers
- Collect 91 skeletal measurements from x-ray images

- Do principal component analysis, which classifies phenotypic variation into independent systems of correlated traits
- Principal components are phenotypes so we can search for markers associated with them

Principal Component 1 (Skeletal Size)

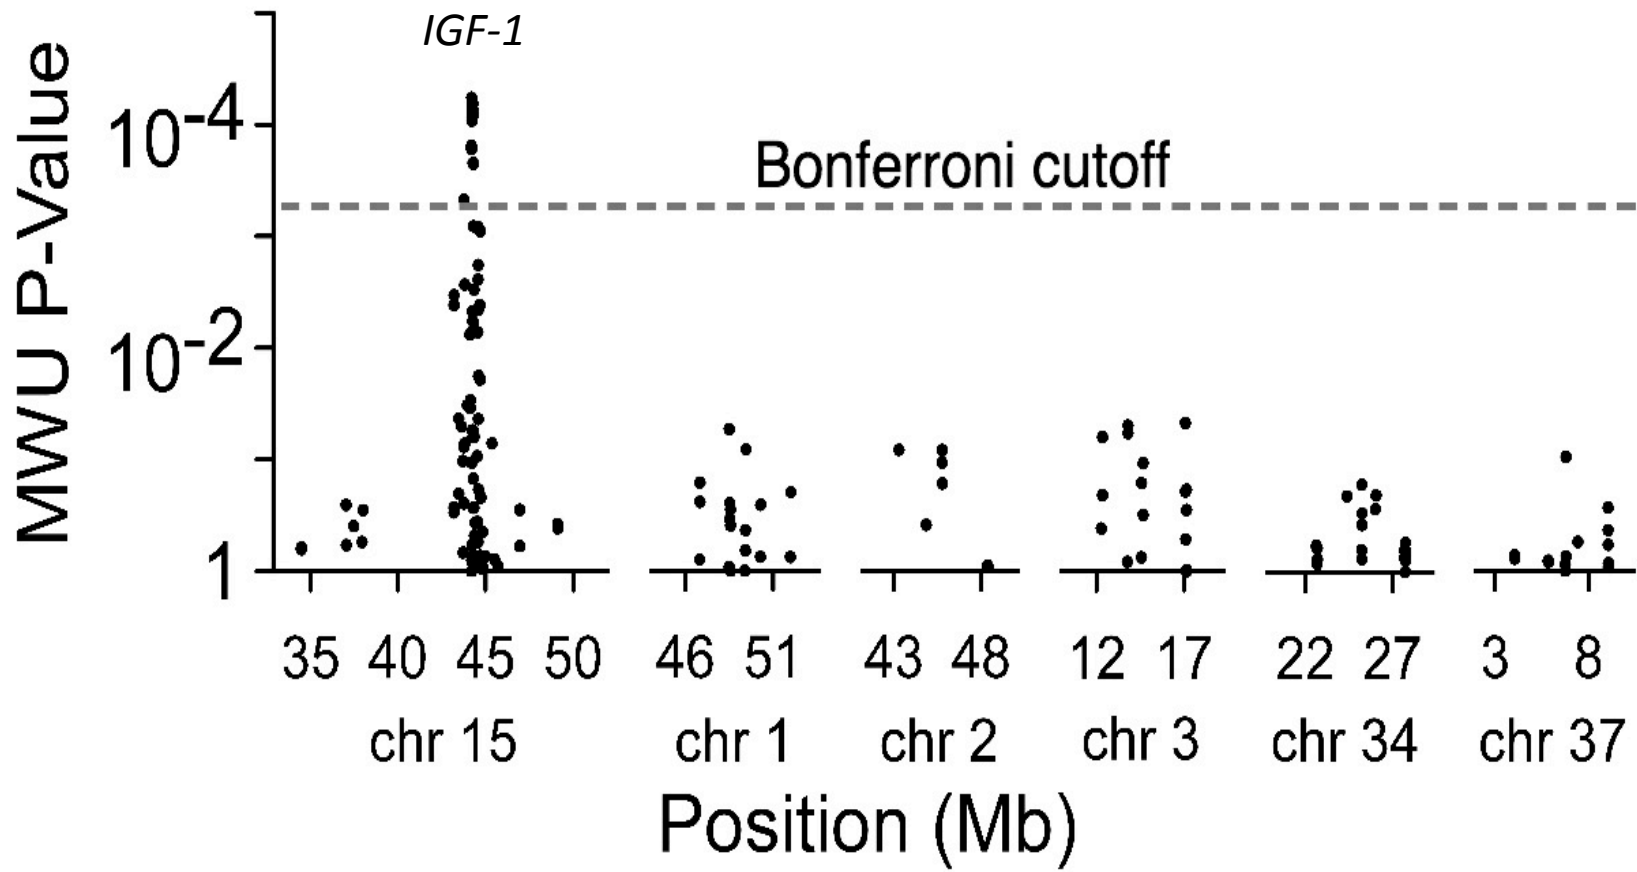

- PC1 is based on 42 metrics from pelvis, fore and hind limbs
- Highly heritable (h^2 0.45)
- 7 QTLs affect size
- A locus of interest: **FH2017 on CFA15 is linked to *IGF1*!**
- Extensive re-sequencing near *IGF1* led to SNP discovery

Step 2: Selective and association mapping

(kg)	Breed
2	Chihuahua
2	Toy Fox Terrier
2	Pomeranian
3	Yorkshire Terrier
3	Japanese Chin
3	Chinese Crested
4	Italian Greyhound
4	Pekingese
5	Shih Tzu
6	Cav. King Charles Spar
6	Border Terrier
7	Miniature Schnauzer
7	Jack Russell Terrier
8	Boston Terrier
32	Giant Schnauzer
44	Akita
45	Bernese Mountain Dog
49	Great Pyrenees
54	Bullmastiff
54	Irish Wolfhound
59	Saint Bernard
	Great Dane
	Mastiff
<9	All Small Dogs
>31	All Giant Dogs

Step 2: Association mapping

Step 3: Association mapping

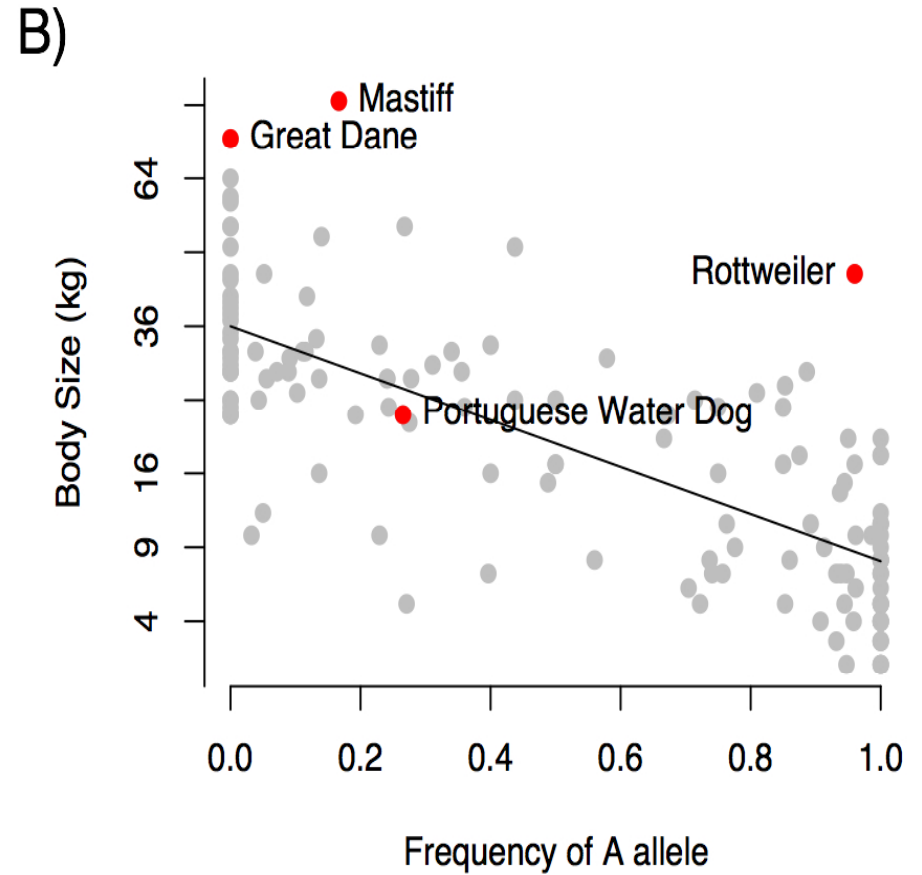

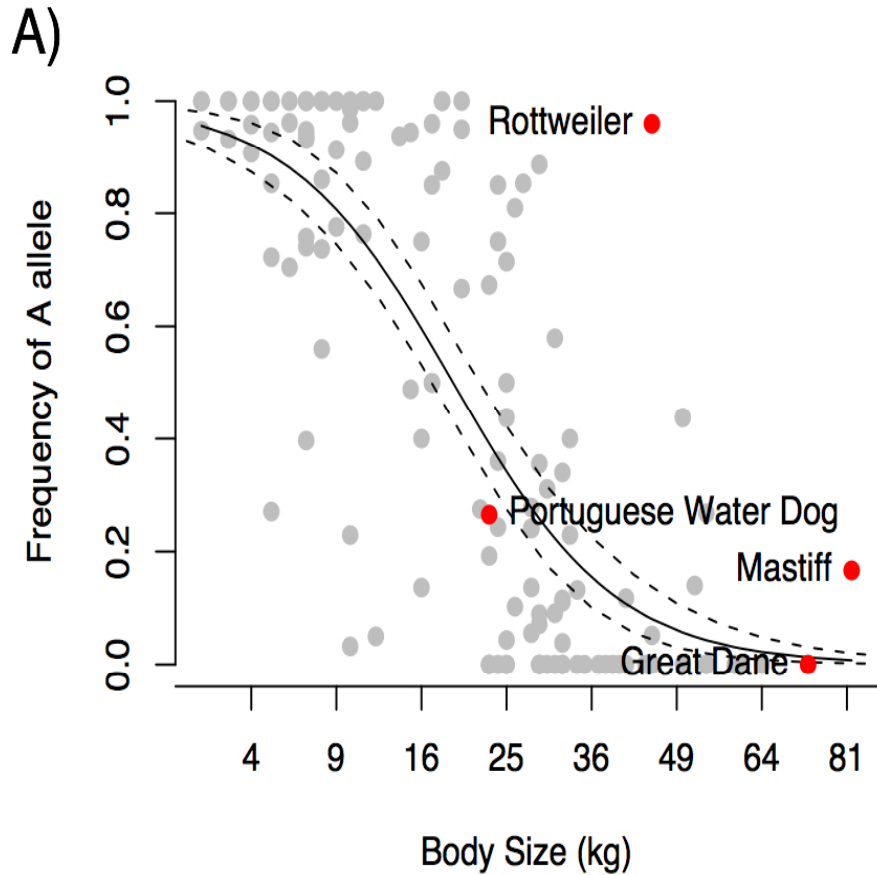

Core region of 8.7 kb
contains only two
possible causative
mutations

1. SINE element
2. CA_n mutation in *IGF1* promoter

Recombination Graph

IGF-1 explains more than 50% of the variation across 143 breeds

Middle Eastern Wolves have sequences related to the small allele

Small haplotype

Middle East

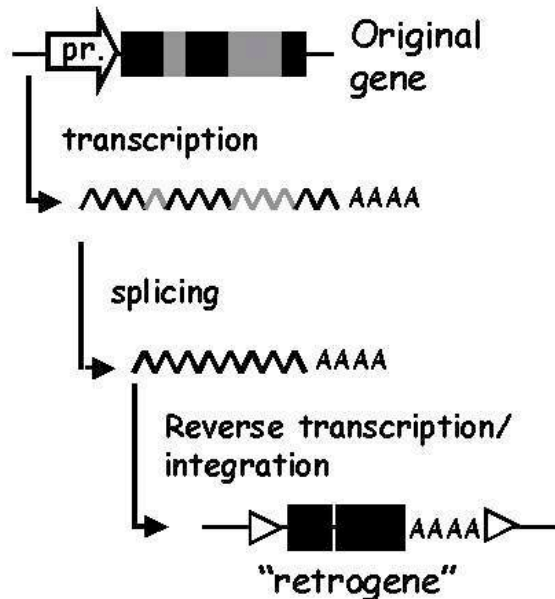

c. The short legs gene: association mapping

Parker et al. *Science*, 2009

Dogs with foreshortened limbs are genetically engineering by nature!

A. Retrotransposition

Pseudogene features

- Absence of introns and promoter sequences
- flanked by direct repeats
- presence of poly-A tract
- randomly integrated anywhere in the genome

Dogs with foreshortened limbs expressive retrogene and normal genes

Adults

Juveniles

Parker et al. Science, 2009

d. Fur Types

Smooth-coated, Long-haired and Wire-haired Dachshunds

RSPO2 (encoding R-spondin-2)

Three mutations in various combinations explain the observed pelage phenotype of 95% of dogs sampled

	PHENOTYPE	<i>FGF5</i>	<i>RSPO2</i>	<i>KRT71</i>	A Basset Hound	B Australian Terrier	C Airedale Terrier
A	Short	-	-	-			
B	Wire	-	+	-			
C	Wire and Curly	-	+	+			
D	Long	+	-	-			E Bearded Collie
E	Long with Furnishings	+	+	-			
F	Curly	+	-	+		F Irish Water Spaniel	G Bichon Frisé
G	Curly with Furnishings	+	+	+			

(encoding R-spondin-2, fibroblast growth factor-5, and keratin-71)

e. The number of genes

Table 1 | Estimates of heritability and number of loci for several complex traits

Disease	Number of loci	Proportion of heritability explained
Age-related macular degeneration ⁷²	5	50%
Crohn's disease ²¹	32	20%
Systemic lupus erythematosus ⁷³	6	15%
Type 2 diabetes ⁷⁴	18	6%
HDL cholesterol ⁷⁵	7	5.2%
Height ¹⁵	40	5%
Early onset myocardial infarction ⁷⁶	9	2.8%
Fasting glucose ⁷⁷	4	1.5%

Manolio (2009)
Nature 46: 747

* Residual is after adjustment for age, gender, diabetes.

(Boyko et al. 2010)

Residual of Maximum Cranial Width (MCW)

Residual of Zygomatic Width (ZW)

Residual of Least Cranial Width (LCW)

Residual of Cranial Depth (CD)

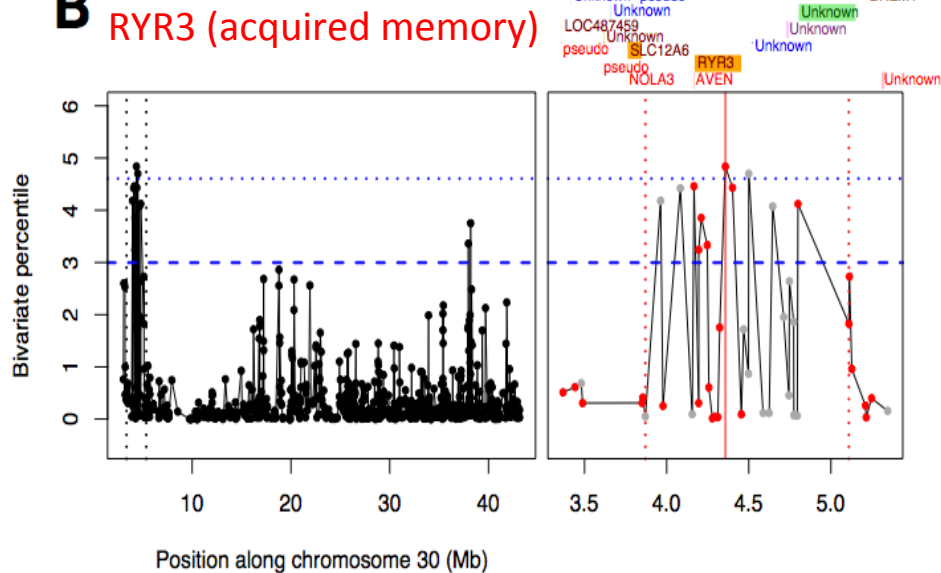

AA similarity to neurotrimin an an opioid receptor (involved in the stress response process)

What makes a dog a dog?

Alluring story-telling II...

- WBSR17: Williams syndrome (WS; also Williams-Beuren syndrome or WBS) is a rare neurodevelopmental disorder caused by a deletion of about 26 genes from the long arm of chromosome 7. It is characterized by a distinctive, "elfin" facial appearance, along with a low nasal bridge; an unusually cheerful demeanor and ease with strangers, coupled with unpredictably occurring negative outbursts; a predisposition to violent outbursts; mental retardation coupled with unusual (for persons who are diagnosed as mentally retarded) language skills; a love for music; and cardiovascular problems, such as supravalvular aortic stenosis and transient hypercalcaemia.

Ancient & Spitz breeds

Supplemental Table 4. History of breeds with discordant phenotypic/functional and genetic group assignments^{2,3}.

Breed Name	Genetic Cluster (see Fig. 1)	Phenotypic/ Functional Group	Breed Information ^{2,3}	Concordance with Historical Evidence
Briard	Small Terrier	Herding	Possible East Asian origin from crosses with local dogs to create a new breed used for flock guarding	No historical evidence for breed admixture between small terriers and herding dogs
Brussels	 Toy	Terriers	European origins from crosses with Affenpinscher (terrier) and Toy breeds (i.e. English Toy Spaniels, Yorkshire Terriers, Pekingese, or Pug) to miniaturize the breed	Evidence for breed admixture between toy and terrier breeds
Chihuahua	 Toy	Ancient	Probable Chinese origins with introduction to Mexico from Spanish traders returning from East Asia	Evidence for breed admixture between East Asian Ancient and toy breeds
German Shep. Dog	Gun	Herding	European breed with recent origins	Inconclusive
Gt. Schnauzer	Gun	Herding	European origins likely from crosses with smooth-haired dogs and possibly Great Danes	Inconclusive
Glen of Imaal	 Mastiff-like	Terriers	European origins from crosses of Bullterriers, Staffordshire terriers (Mastiff-like breeds) and other fighting dogs; Glen of Imaal is an aggressive hunter (e.g. badgers, rats)	Evidence for admixture between Mastiff-like and terrier breeds
Mini. Pin.	 Toy	Terriers	European origins from crosses of German Pinscher (terrier) and Dachshunds or Italian greyhounds	Evidence for admixture between toy and terrier breeds
Newfoundland	 Retrievers	Mastiff-like	North American origins with possible crosses to Mastiff or Portuguese Water dog; considered an ancestor of the modern Labrador Retriever	Evidence for Retriever and Mastiff-like breed admixture
Papillon	 Toy	Spaniels	European origins from crosses of Spaniels and Bichon-type (toy) breeds	Evidence for admixture of toy and spaniel breeds
Pekingnese	 Toy	Herding	Chinese origins; considered a dwarfed Tibetan terrier or Pug (toy)	Evidence of admixture of toy and other breeds
Pomeranian	Toy	Spitz	European origins from crossing European herding and spitz-type breeds	Inconclusive
Portuguese Water Dog	Gun	Spaniels	European origins; bred to be a water dog	Inconclusive
Pug	 Toy	Mastiff-like	Chinese origins; considered a "mini-mastiff", likely from miniaturizing the Affenpinscher (Terrier) or the English Bulldog and crossing with the Tibetan Mastiff (Mastiff-like breeds)	Evidence for breed admixture of Mastiff-like and toy breeds
Shih Tzu	 Toy	Herding	Tibet/Chinese origins; considered a dwarf of Tibetan terriers or Lhasa Apsos (herding breeds)	Evidence for admixture of Toy and herding breeds
Std. Schnauzer	Gun	Herding	European origins from crossing the Standard Pinscher, Poodles, "Wolfspitzs", or Shepherds	Inconclusive

Dog Origins Revisited

Dogs share more unique haplotypes with European and Middle Eastern Wolves

Kirk Loemüller
(Cornell/Stanford)

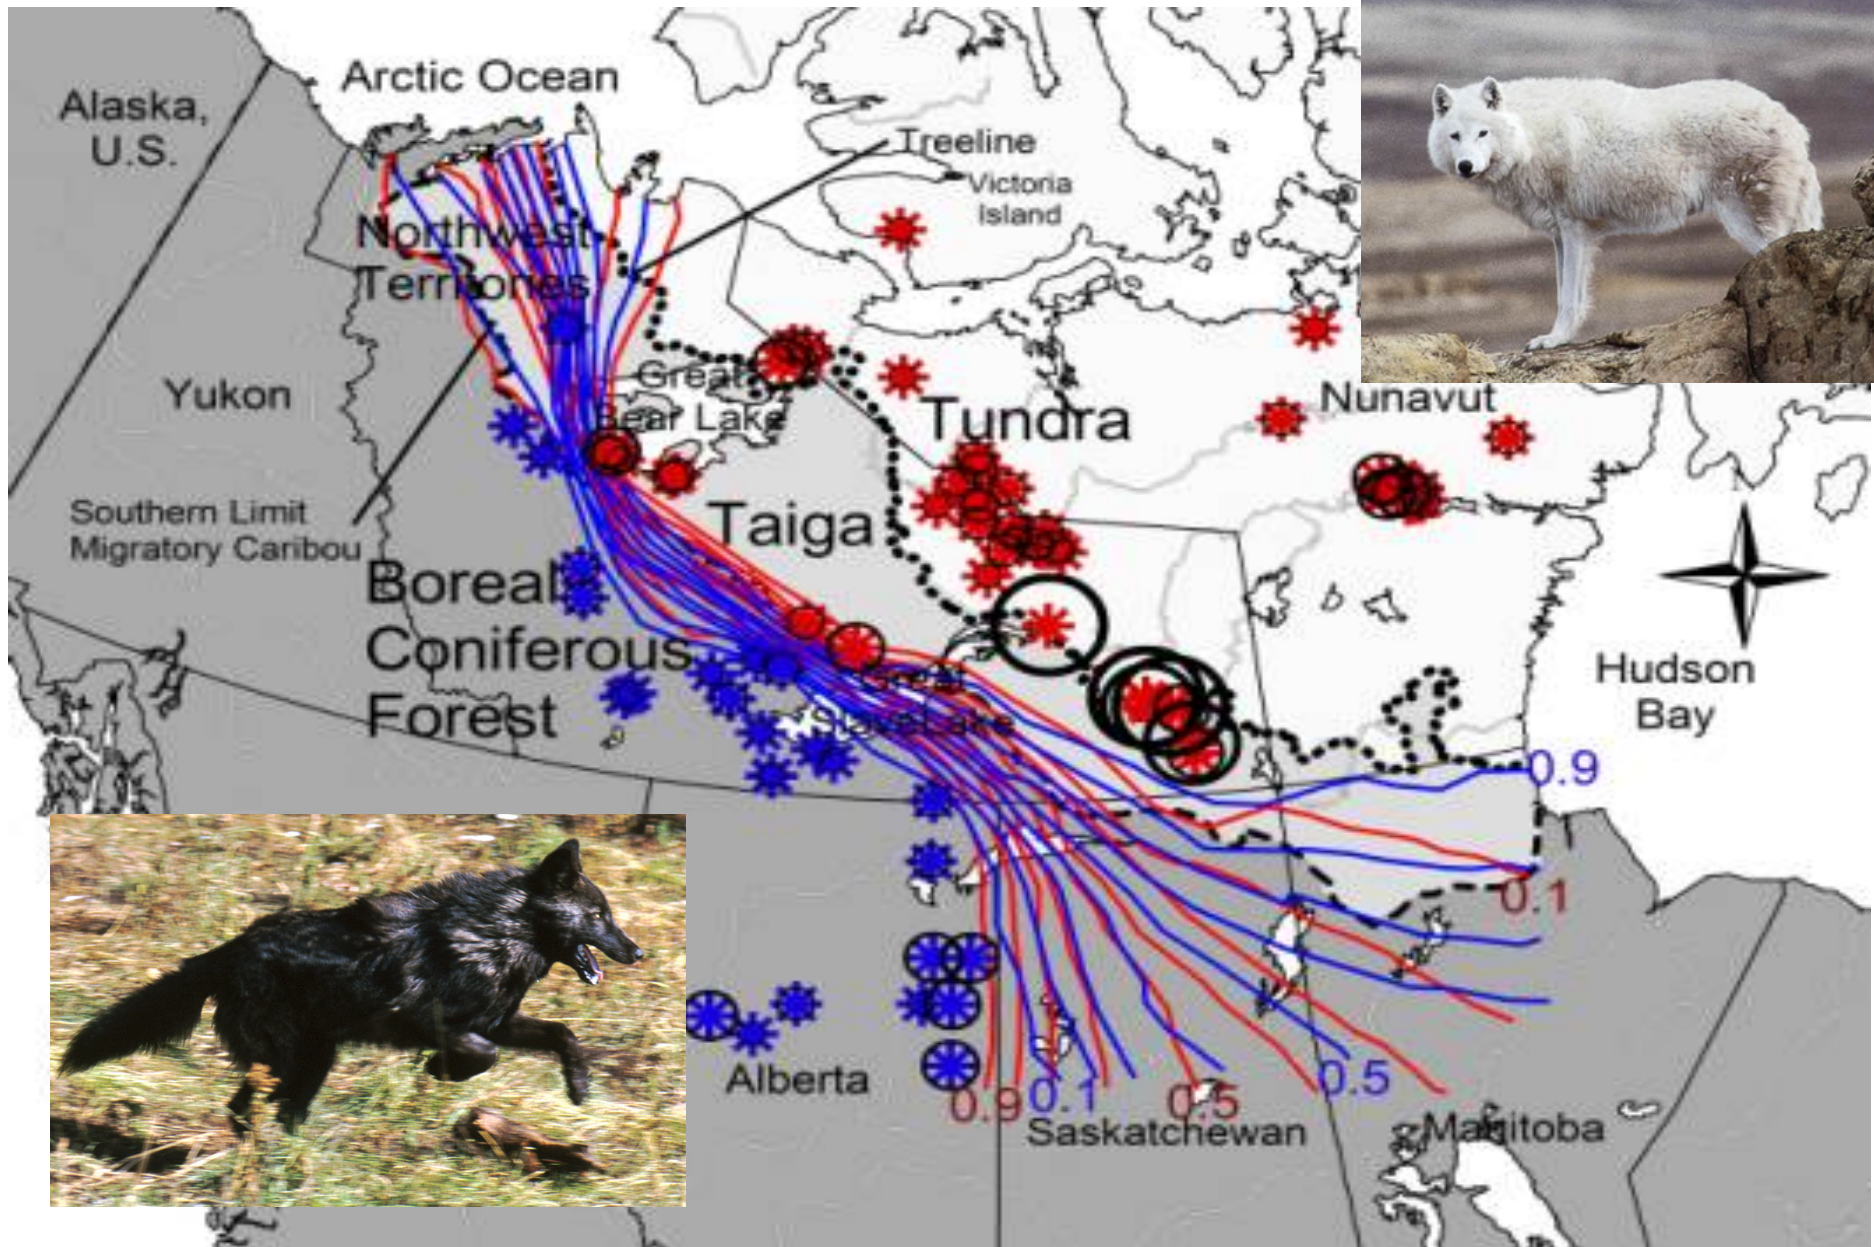

Questions

- 1) The primary reason body size differs among dogs breeds is:
 - a. A single gene of large effect
 - b. Multiple genes of small effect
 - c. Nutritional differences
 - d. Exercise differences
 - e. None of the above

- 2) Unlike other domesticated species, dogs phenotypes are determined by
 - a. Multiple genes of small effect
 - b. A few genes of large effect
 - c. One master gene
 - d. Transposable elements

- 3) Diversity in dogs is limited in part by:
 - a. Human creativity
 - b. Expense of breeding
 - c. Longevity
 - d. The nature of mutations

3. Engineering in the wild: black and gray coat colors of wolves

Fawn

Anderson et al., 2009, Science

Dogs have enriched the genetic heritage of wolves

Genetic variants that are selected under domestication can transform wild progenitor populations

Black Wolves Live longer

Number at risk

black	50	50	35	38	27	20	14	11	6	2	1
gray	73	69	49	37	30	26	19	8	6	4	1

CONCLUSIONS

- 1) The engineering of the dogs has involved a relatively small number of genes of large effect.
- 2) These genetic variants have been transferred to established breeds by crossing. The results is the expression on different genetic backgrounds and enhanced phenotypic diversity.
- 3) Mutation, as well as goal driven selection, limits diversity in dogs.
4. Variants selected under domestication can transform their wild kin.

4. The future, Genomic and expression studies

Mass sequencing technology has become a practical tool

Roche GS FLX 454 Genome Sequencer

Sequencing reaction of the Genome Sequencer System. Millions of copies of a single clonal fragment are contained on each DNA Capture Bead.

- Pyrosequencing technology
- Clonal amplification of starting material
- **500 million bp per run (1 million reads at average 400-500bp length)**
- 10 hour run
- Ability to run 2, 4, 8 & 16 separate lanes (physical separation)
- 10bp tags built into 454 adaptors allow further sample pooling (160 unique tags available)
- Cost ~\$15/1000 reads
