

HC70A, PLSS530, & SAS70A Winter 2014 Genetic Engineering in Medicine, Agriculture, and Law

Professors Bob Goldberg, Channapatna Prakash, & John Harada

Lecture 3 What Are Genes & How Do They Work: Part One

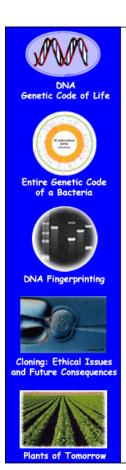

PREVIOUS TWO LECTURES

- Genetic Engineering Origins
- What Can Be Done With Genetic Engineering?
- Classical vs. Molecular Genetic Engineering
- Demonstrations
 - Spooling DNA
 - Vegetables Classic Genetic Engineering

THEMES FOR TODAY'S LECTURE Gene Structure & Function Part One (Text Chapter 2)

- What is the Function of a Gene?
- What are the Properties of Genes?
- What is the Evidence That DNA is the Genetic Material (Griffith and Avery Experiments)?
- Is Transformation Universal?
- What is the Structure of DNA?
- What is the Structure of a Chromosome?
- What is the Colinearity Between Genes & Proteins (how does DNA→protein)?
- How Do We Know That Genes Function Independently of One Another?
- What is the Anatomy of a Gene?
- How Do Switches Work to Control Gene Activity?
- What Are the Possibilities For Manipulating Genes in the Future?
- **Demonstration:** "Bacterial Cloning"

Recall....Science is NOT "Hocus Pocus" or Based on Opinions and Beliefs

·Science is Based on Observation, Hypothesis Testing, Rigorous Experimentation, and Verification

·Technology, or the Application of Scientific Knowledge, Has Transformed Dramatically Our Lives and How We Live

What Are the Data!!!!!

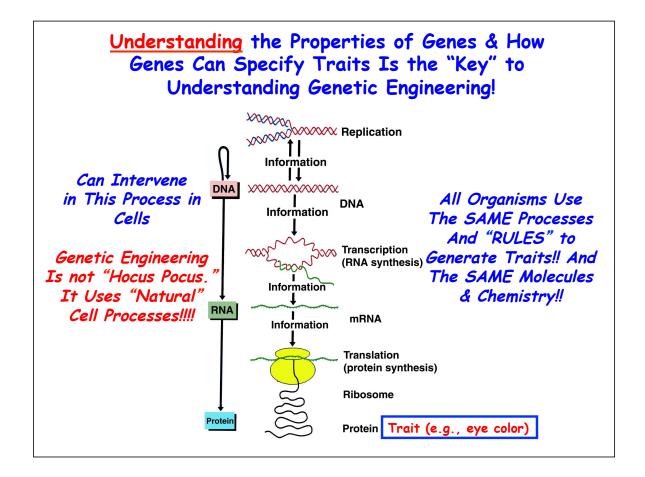

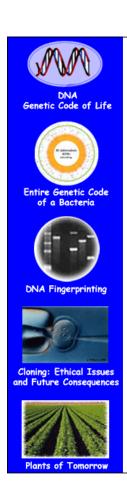

And.....Genetic Engineering Is
Manipulating DNA <u>Either Classically or By</u>
<u>Exciting Modern Approaches</u> (GE 1.0 and 2.0)!
It's a Scientific Process
Not Hocus Pocus

Understanding Genetic Engineering Requires a Basic Understanding of Genes And How They Work

WHAT ARE THE PROPERTIES OF A GENE?

- 1. Replication
- 2. Stability (Mutations)
- 3. Universality
 - a) All Cells
 - b) All Organisms
- 4. Direct Cell Function/Phenotype

Design an Experiment to Show That DNA is The Genetic Material?

- · How Can These Properties Be Tested Experimentally?
 - · What Predictions Follow From These Properties?

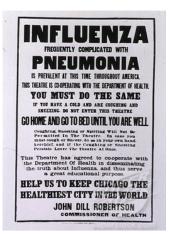

If DNA is the Genetic Material, THEN What.....?

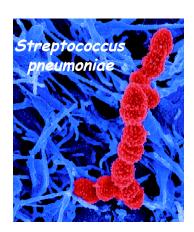

Evidence That DNA Is the Genetic Material Starts With Pneumonia

PNEUMONIA KILLS 990 IN CITY SINCE JAN. 1; Forty-Eight Die in Twenty-Four Hours, Four Fewer Than on Previous Day. 387 INFLUENZA CASES Six More Deaths Reported, but Copeland Sees Chief Danger in First-Named Disease.

January 29, 1922 - New York City

Spanish Flu (viral) Was also "Killer" at This Time!

The Mair Board of Health order, closing schools, theatres, charches, saloons, etc., in an effort to prevent a forther spread of the Spanish Influenza epidemic, is a sweeping one. All clubs must close, including bowling alleys and pool rooms. No society, club or organization meeting can be held, not even at homes.

Spanish Flu Killed 50-100 million people world-wide from 1918 to 1920 - Most From Secondary Bacterial Infections

The Spanish Flu Pandemic - 1918 to 1920

It is estimated that anywhere from 50 to 100 million people were killed world wide - the approximate equivalent of one third of the population of Europe, more than double the number killed in World War I. This extraordinary toll resulted from a high death rate of up to 50%.

Characterization of the 1918 "Spanish" influenza virus neuraminidase gene PNAS June 6, 2000

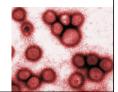

Ann H. Reid,* Thomas G. Fanning, Thomas A. Janczewski, and Jeffery K. Taubenberger

Researchers detect deadly Spanish flu genes

A team of researchers in Japan and the United States have determined the causative genes for the Spanish flu that reportedly claimed the lives of some 40 million people around the world in 1918. $\,$ PNAS January, 2009

By Sequencing the Virus Genome From Victims Dead For 80 Years & Synthesizing the "Original" Flu Virus By Genetic Engineering

Major Causes of Death in USA

1920 (CDC)

- 1. Pneumonia
- 2. Heart Disease
- 3. Tuberculosis
- 4. Stroke
- 5. Kidney Disease
- 6. Cancer
- 7. Unintentional Accidents (excluding cars)
- 8. Diarrhea, Enteritis, Intestinal Lesions
- 9. Premature Birth
- 10. Maternal Death Giving Birth

Note: Based on 1.1 M Deaths (1,300 per 100,000). Child Mortality = 100 per 1,000

2011 (CDC)

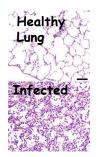

- 1. Heart Disease
- 2. Cancer
- 3. Chronic Respiratory Diseases (e.g., Emphysema & Bronchitis)
- 4. Stroke
- 5. Unintentional Accidents (e.g., Cars)
- 6. Alzheimer's Disease
- 7. Diabetes
- 8. Kidney Disease
- 9. Influenza & Pneumonia
- 10. Intentional Self Harm (Suicide)
- 11. Septicemia (Bacteria)

Note: Based on 2.5M Deaths (741 per 100,000). Child Mortality 6 per 1,000

Frederick Griffith & The Transforming Principle

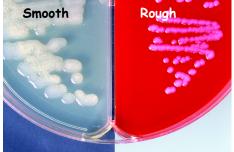

The First Genetic Engineering Experiment (unintentional!)

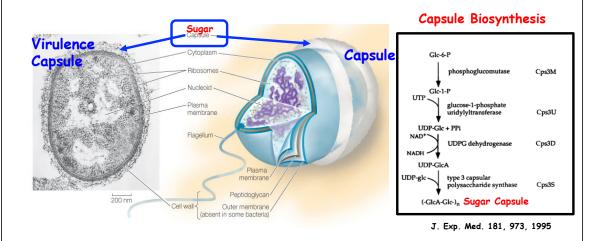

1879-1941

Invented the Word <u>"Transformation"</u>
Not Understood For Another 50 Years

Streptococcus pneumoniae

The Sugar Capsule Protects the Bacteria From Mammalian Host Antibodies

Capsule = Virulence No Capsule = Avirulence

Bacterial Genome Projects Have Provided Remarkable Insight Into Bacterial Genomes and Cell Functions

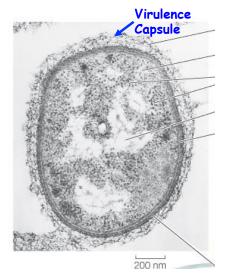

Table 1-1 Some Genomes That Have Been Completely Sequenced

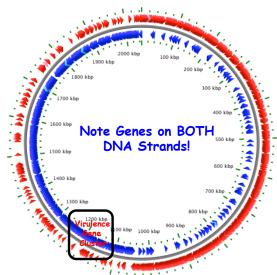

SPECIES	SPECIAL FEATURES	НАВІТАТ	GENOME SIZE (1000s OF NUCLEOTIDE PAIRS PER HAPLOID GENOME	ESTIMATE NUMBER OF GENES CODING F
BACTERIA				8,000 G
Mycoplasma genitalium	has one of the smallest of all known cell genomes	human genital tract Made	580 Synthetically!	468
Synechocystis sp.	photosynthetic, oxygen-generating (cyanobacterium)	lakes and streams	3573	3168
Escherichia coli	laboratory favorite	human gut	4639	4289
Helicobacter pylori	causes stomach ulcers and predisposes to stomach cancer	human stomach	1667	1590
Bacillus anthracis	causes anthrax	soil	5227	5634
Aquifex aeolicus	lithotrophic; lives at high temperatures	hydrothermal vents	1551	1544
Streptomyces coelicolor	source of antibiotics; giant genome	soil	8667	7825
Treponema pallidum	spirochete; causes syphilis	human tissues	1138	1041
Rickettsia prowazekii	bacterium most closely related to mitochondria; causes typhus	lice and humans (intracellular parasite)	1111	834
Thermotoga maritima	organotrophic; lives at very high temperatures	hydrothermal vents	1860	1877

12,982 Bacterial Genomes Have Been Sequenced to Date (January, 2014)

Monomers

The Avery et al. Experiment Showed <u>Conclusively</u> that DNA is the Genetic Material?

a. yes b. no

THE Critical Experiment by Avery et al. Showing That DNA IS THE Genetic Material

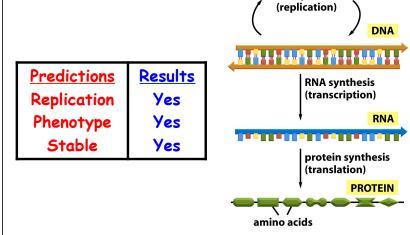

When DNase Destroyed DNA There Was No Transformation & Only Rough Cells Were Found in the Culture

If Smooth DNA Not Present, Rough Cells Cannot Be Transformed Into Smooth Cells!

How Did Avery et al. Experiments <u>Verify the</u> Hypothesis That DNA is the Genetic Material

DNA synthesis

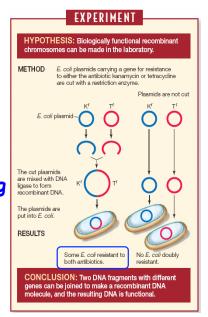

Cell Processes

- 1. S DNA Taken Up By R-Cells
- 2. S Gene Transcribed Into S mRNA
- 3. S mRNA
 Translated
 Into Smooth
 Protein
- Smooth Protein Helps Construct Sugar Capsule and Protects Bacteria From Antibodies ∴Cells Virulent

Transformation is a Basic Genetic Engineering Process Today!
Transformation=Ability of Cell Phenotype To Be Changed by DNA!

Can Bacteria Be Transformed With Other Genes and Traits?

Cohen & Boyer
Experiment That
"Invented"
Genetic Engineering

Because the Transforming Principle is DNA

Any Gene Can Be Transformed (e.g., Antibiotic^R to Antibiotic^S)

All Organisms Can Be Transformed!! Genetic Engineering Has Come a Long Way Since Griffiths Experiments in 1928!!

Genetic Engineering/Transformation Involves Incorporating Engineered DNA or Genes Into Different Organisms

Genotype

Phenotype

Engineered Gene MUST

- 1. Enter Target Cell
- 2. <u>Use Target Cell Machinery</u> Enzymes to <u>Become Part</u> of <u>Chromosome</u>
- 3. Replicate with Target Cell Chromosome
- 4. Use Target Cell Protein Synthesis
 Machinery to Make a New Protein
 → Phenotype Trait!

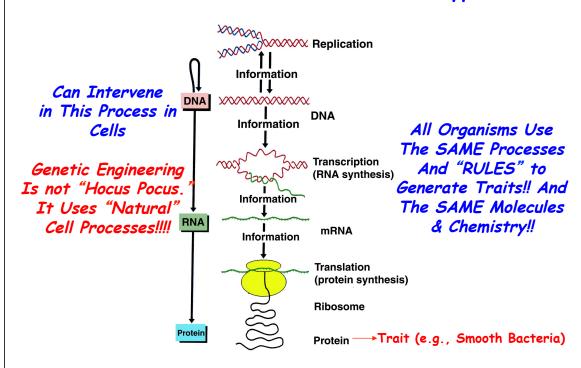

Engineered Gene CAN BE

- 1. From Same Organism
- 2. From Different Organism
- 3. From a Combination of Organisms stitched together by Genetic Engineering

Gene Engineering Shows that Gene Processes Are Universal!!!

Just Like The GlowGene Experiments!!!

Transformation of Cells With DNA Uses Normal Cellular Processes To Produce a New Phenotype

- This is the Basis For All of Biology
- Order is Maintained During DNA Replication
- 4. Basis of All Genetic Engineering

Clues to the Double Helix-Chargaff's Rules Purines = Pyrimidines

TABLE 6.1 Chargaff's Data on Nucleotide Base Composition in the DNA of Various Organisms

	Percentage of Base in DNA				Ratios		
Organism	Α	Т	G	С	A:T	G:C	
Staphylococcus afermentams	12.8	12.9	36.9	37.5	0.99	0.99	
Escherichia coli	26.0	23.9	24.9	25.2	1.09	0.99	
Yeast	31.3	32.9	18.7	17.1	0.95	1.09	
Caenorhabditis elegans*	31.2	29.1	19.3	20.5	1.07	0.96	
Arabadopsis thaliana*	29.1	29.7	20.5	20.7	0.98	0.99	
Drosophila melanogaster	27.3	27.6	22.5	22.5	0.99	1.00	
Honeybee	34.4	33.0	16.2	16.4	1.04	0.99	
Mus musculus (mouse)	29.2	29.4	21.7	19.7	0.99	1.10	
Human (liver)	30.7	31.2	19.3	18.8	0.98	1.03	

^{*}Data for C. elegans and A. thaliana are based on those for close relative organisms.

Note that even though the level of any one nucleotide is different in different organisms, the amount of A always approximately equals the amount of T, and the level of G is always similar to that of C. Moreover, as you can calculate for yourself, the total amount of purines (A plus G) nearly always equals the total amount of pyrimidines (C plus T).

What Would You Predict For a Single-Stranded DNA?

THE COMPOSITION OF THE DESOXYPENTOSE NUCLEIC ACIDS OF THYMUS AND SPLEEN*

J. Biological Chemistry, July, 1948

The New york Times

Obituaries

Erwin Chargaff, 96, Pioneer In DNA Chemical Research

By NICHOLAS WADE

Erwin Chargaff, whose research into the chemical composition of DNA helped lay the groundwork for James Watson and Francis Crick's discovery of its double-helix structure — the pivotal finding of 20th-century biology — died on June 20 in a New York hospital. He was 96.

As a biochemist at Columbia University in the 1940's, Dr. Chargaff discovered regularities among the four chemical units of DNA known as bases pointing directly to its role as the hereditary material of living organisms. But he was unable to interpret the meaning of his finding, a failure that allowed Dr. Watson and Dr. Crick to do so when they ascertained the structure of DNA.

Dr. Chargaff's data helped both in the two young scientists' discovery and even more in its acceptance by other scientists. The base composition was an essential clue for finding the structure of DNA, there's no doubt about that," Dr. Watson said in an interview. "We could have come up with the answer, but no one would have believed it."

Dr. Chargaff later became a forceful if lonely critic of molecular biology, accusing its practitioners of "practicing biology without a license" when they learned to move genes from one organism to another.

A man of wide culture and learning, he did not fit easily into the sharply focused world of scientific specialists. Ever the European, he found much in American life to criticize, despite his long and productive tenure at Columbia. He cherished the outsider's role, modeling his sardonic view of the world on the writings of Karl Kraus, the Viennese satirist.

"I have not fitted well," Dr. Chargaff wrote in 1975, "into the country and the society in which I had to live; into the language in which I had to converse; yes, even into the century in which I was born."

Erwin Chargaff was born on Aug. 11, 1905, in Czernowitz, then a provincial capital of the Austrian monarchy. His father, Hermann, was a bunker who later lost his business. Of his mother, Rosa Silberstein, he wrote that she died, "only God knows where and when, having been deported into nothingness from Vienna in 1943." He is survived by his only son, Thomas.

As a young man, Dr. Chargaff studied chemistry at the University of Vienna. He worked at the University of Berlin and then at the Pasteur Institute in Paris before arriving at Columbia University in 1935. After reading the 1944 report by Oswald Avery that identified DNA as the hereditary material, Dr. Chargaff switched his laboratory to the study of DNA and the four bases, or chemical groups, of which it is composed—adenine, cytosine, guantine and thymine.

He soon noticed a striking regularity about the base composition of DNA: from whatever plant or animal he derived DNA, the amounts of adenine and thymine were almost the same, and so were the amounts of cytosine and guanine.

Dr. Chargaff published the result but made little progress in understanding the reason for the regularity, which is that adenine on one of the DNA molecule's two strands is always paired with thymine on the other, as is cytosine with guanine. But in a fateful and testy lunch in May 1952, he discussed his results with Dr. Watson and Mr. Critic (who did not yet have his doctorate).

"They impressed me by their extreme ignorance," he later told Horace Judson, the historian of the discovery of DNA. "They told me they wanter to construct a helix, a polynucleotide to rival Pauling's alpha helix. They talked so much about 'pitch' that I remember I wrote down afterwards, Two titchmen in search of a helix."

He later wrote that "I believe that the double-stranded model of DNA came about as a consequence of our conversation." Mr. Judson, however, in an appendix to a new edition of his book "The Eighth Day of Creation" (Cold Spring Harbor Press, 1996), concluded that Dr. Chargaff's claim was something of a stretch, since Dr. Watson and Dr. Crick had not at that time hit on the concept of base pairing, nor had Dr. Chargaff alloded to it in his publications.

Though Dr. Chargaff tended toward the sardonic, it was hard for observers to understand the depth of his bitterness in his attitude to his fellow scientists. The reason, besides his disappointment at having missed discovering the structure of DNA, was that he was pushed to the sidelines by Dr. Crick in the worldwide effort to interpret the structure.

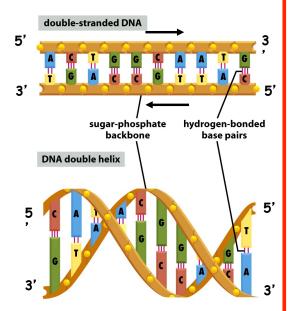

"By 1958," Mr. Judson writes, "Dr. Chargaff was denouncing molecular biology and its practitioners for arrogance, ignorance, reductionism ar self-serving sensationalism."

"The
technology of
genetic
engineering
poses a
greater
threat to the
world than
the advent
of nuclear
technology"

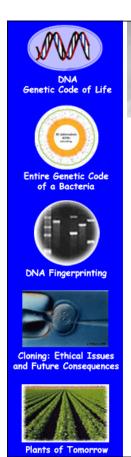

DNA is a Double Helix of Two Complementary Chains of DNA Wound Around Each Other

GENETICAL IMPLICATIONS OF THE STRUCTURE OF DEOXYRIBONUCLEIC ACID

By J. D. WATSON and F. H. C. CRICK

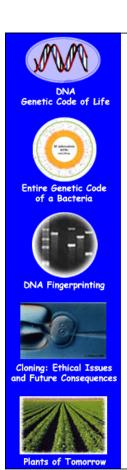

Medical Research Council Unit for the Study of the Molecular Structure of Biological Systems, Cavendish Laboratory, Cambridge Nature, May 30, 1953

Our model suggests possible explanations for a number of other phenomena. For example, spontaneous mutation may be due to a base occasionally occurring in one of its less likely tautomeric forms. Again, the pairing between homologous chromosomes at meiosis may depend on pairing between specific bases. We shall discuss these ideas in detail elsewhere.

For the moment, the general scheme we have proposed for the reproduction of deoxyribonucleic acid must be regarded as speculative. Even if it is correct, it is clear from what we have said that much remains to be discovered before the picture of genetic duplication can be described in detail. What are the polynucleotide precursors? What makes the pair of chains unwind and separate? What is the precise role of the protein? Is the chromosome one long pair of deoxyribonucleic acid chains, or does it consist of patches of the acid joined together by protein?

Despite these uncertainties we feel that our proposed structure for deoxyribonucleic acid may help to solve one of the fundamental biological problemsthe molecular basis of the template needed for genetic replication. The hypothesis we are suggesting is that the template is the pattern of bases formed by one chain of the deoxyribonucleic acid and that the gene contains a complementary pair of such templates
