Animals Can Also be Used as Factories to Produce Large Amounts of Human Proteins

Advantages of Molecular Pharming

1. Many human proteins need to be modified after translation to be active. Only eukaryotic cells can do this.
2. Bacteria need big fermentors + elaborate protein purification schemes-Farm animals can be used for this purpose w/o special processing/machinery.
3. Proteins stable, can be made in large amounts, and purified easily

F.D.A. Approves Drug From Gene-Altered Goats

Examined Data From Seven Generations of Genetically Engineered Goats

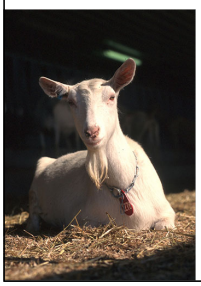
New Drug From Genetically Engineered Goat

FDA OKs ATryn, 1st Drug Made in Milk of a Genetically Engineered Animal

By Miranda Hitti
WebMD Health News

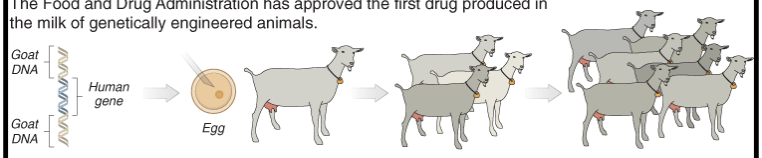
Feb. 6, 2009 -- The FDA today approved ATryn, the first drug made in genetically engineered animals.

Issues
Food Supply?
Containment?
Animal Health?
Effective Drug?



Bioengineering on the Farm

The Food and Drug Administration has approved the first drug produced in the milk of genetically engineered animals.



MODIFYING THE DNA
A human gene that produces the blood protein antithrombin is inserted into a short strand of goat DNA.

IMPLANTING THE DNA
The modified DNA is injected into the nucleus of a fertilized goat egg, which is then implanted into a female.

TESTING THE OFFSPRING
Kids born from the modified eggs are tested for the presence of antithrombin in their milk. Promising kids are bred normally to create a herd of modified goats.

EXTRACTING THE PROTEIN
Milk from the herd is filtered and purified. Annually, each goat can produce as much antithrombin as 90,000 human blood donations.

Genetically Engineered Drug-Producing Mammals Can Also Be Cloned

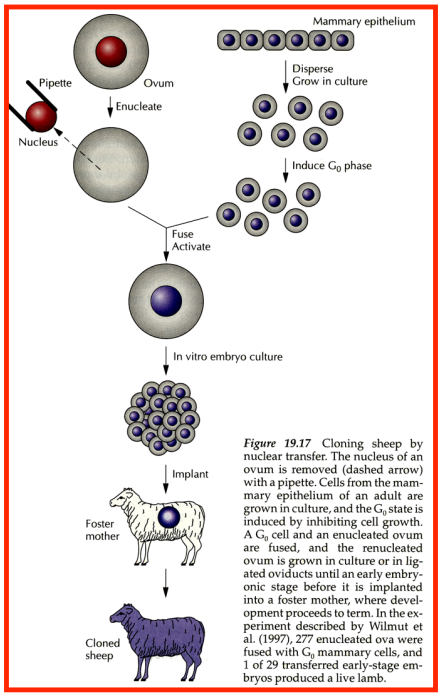

Figure 19.17 Cloning sheep by nuclear transfer. The nucleus of an ovum is removed (dashed arrow) with a pipette. Cells from the mammary epithelium of an adult are grown in culture, and the G_0 state is induced by inhibiting cell growth. A G_0 cell and an enucleated ovum are fused, and the renucleated ovum is grown in culture or in ligated oviducts until an early embryonic stage before it is implanted into a foster mother, where development proceeds to term. In the experiment described by Wilmut et al. (1997), 277 enucleated ova were fused with G_0 mammary cells, and 1 of 29 transferred early-stage embryos produced a live lamb.

Somatic Cells Can Also Be Genetically Engineered and Then Inserted Into Egg

And Don't Forget Plants!

First plant-made biologic approved

Carrot cell bioreactors

The US Food and Drug Administration in May approved Elelyso (taliglucerase alfa), an enzyme produced in genetically engineered carrot cells, for treating type 1 Gaucher's disease. This is the first plant-made drug approved by the regulators, and for Israeli company Protalix BioTherapeutics of Carmiel, it is the first product made in their ProCellEx protein expression system to reach the market. The plant cell platform produces recombinant proteins with a glycan and amino acid structure similar to naturally produced human counterparts. Some 10,000 patients worldwide have Gaucher's, a rare genetic disorder in which individuals fail to produce the enzyme glucocerebrosidase.

Drug-making plant blooms

Approval of a 'biologic' manufactured in plant cells may pave the way for similar products.

PLANTS IN THE PIPELINE

Manufacturers have begun or completed phase II clinical trials on a handful of biologics made in plants, and hope to follow Elelyso to market.

Drug	Condition	Company	Platform
Locteron (interferon-α)	Hepatitis C	Biolex Therapeutics	Duckweed
H5N1 vaccine	Influenza	Medicago	Tobacco
VEN100	Antibiotic-associated diarrhoea	Ventria Bioscience	Rice
CaroRx	Dental caries	Planet Biotechnology	Tobacco

Elelyso® Made in Engineered Carrot Cells To Treat Gaucher's Disease – A Lysosomal Storage Disease That Prevents Molecules From Being Degraded and Disposed of Properly in Cells – 100x Prevalence in Ashkenazi Jews. Gene on Chromosome 1, and Encodes a Glucocerebrosidase.

FDA

California Vaccination Requirements

GUIDE TO IMMUNIZATIONS REQUIRED FOR SCHOOL ENTRY

Grades K-12

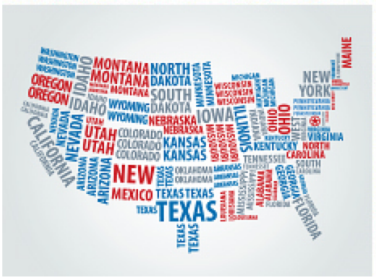
CDPH

INSTRUCTIONS Use this guide as a quick reference to help you determine whether children seeking admission to your school meet California's school immunization requirements. For the actual laws, see Health and Safety Code, Division 105, Part 2, Chapter 1, Sections 120325-120380; California Code of Regulations, Title 17, Division 1, Chapter 4, Subchapter 8, Sections 6000-6075. If you have any questions, call the Immunization Coordinator at your local health department.

IMMUNIZATION REQUIREMENTS To enter into public and private elementary and secondary schools (grades kindergarten through 12, including transitional kindergarten), children under age 18 years must have immunizations.

VACCINE	REQUIRED DOSES
Polio	**4 doses at any age, but...** 3 doses meet requirement for ages 4–6 years if at least one was given on or after the 4th birthday[1]; 3 doses meet requirement for ages 7–17 years if at least one was given on or after the 2nd birthday.[1]
Diphtheria, Tetanus, and Pertussis	***Age 6 years and under:*** DTP, DTaP or any combination of DTP or DTaP with DT (diphtheria and tetanus) **5 doses at any age, but...** 4 doses meet requirements for ages 4–6 years if at least one was on or after the 4th birthday.[1]
	Age 7 years and older: Tdap, Td, or DTP, DTaP or any combination of these **4 doses at any age, but...**3 doses meet requirement for ages 7–17 years if at least one was on or after the 2nd birthday.[1] If last dose was given before the 2nd birthday, one more (Tdap) dose is required.
Measles, Mumps, Rubella (MMR)	***Age 4-6 years*** **(kindergarten and above): 2 doses[2]** both on or after 1st birthday.[1]
	7th grade: **2 doses[2]** both on or after 1st birthday.[1]
	Age 7-17 years and not entering or advancing into 7th grade: **1 dose** on or after 1st birthday.[1]
Hepatitis B[3]	***Age 4-6 years*** **(kindergarten and above): 3 doses.**
Varicella	**1 dose**[4, 6]
Tdap Booster (Tetanus, reduced diphtheria, and pertussis)	***7th grade:*** **1 dose** on or after 7th birthday. [5, 7]

STATE NEWS



California Passes a 'No Exemption' Vaccination Policy for School Children. California Governor Jerry Brown signed S.B. 277 into law. The law will ban the use of personal or religious beliefs as grounds for exemption from vaccination, mandating that all children must be vaccinated by the beginning of school. California joins two other states, Mississippi and West Virginia, which do not have any exemptions for vaccination – though students in all three states may still opt out if a doctor says they should not get vaccinated for a medical reason. The law's passage comes following a deadly outbreak of measles in Disneyland.

Industrial & Food Products Made With Genetic Engineering

Bacteria & Other Microbes Are the Source Of Many Different Products

Enzymes as additives in industry

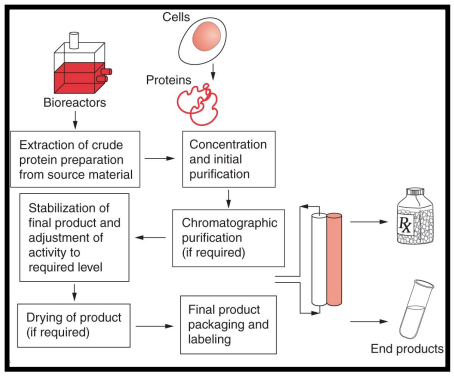
application	enzyme type	organisms (examples)	market size (% of total)	economic advantage
detergents	proteases, cellulases, lipases	*Bacillus licheniformis* *Aspergillus nidulans* *Trichoderma reesei*	40	1
starch hydrolysis	α-amylase	*Bacillus amyloliquefaciens*	5	3, 4
glucose isomerization	glucose isomerase	*Streptomyces venezuelae*	7	1, 3
beer brewing	amylase	*Bacillus subtilis*	3	3, 4
fruit processing, wine	cellulases, hemicellulases, pectinases	*Aspergillus niger*	5	3, 4, 5, 6
flour, bakery goods	α-amylase, proteases	*Aspergillus oryzae*	8	1, 3
cheese manufacture, aroma	proteases, chymosin, lipases	animal rennin, *Rhizomucor miehei*, *Saccharomyces cerevisiae*	12	2
silage and animal feed	phytases	*Aspergillus niger*	8	3
paper and textiles	α-amylase, lipase	*Bacillus, Humicola*	2	4
leather treatment	proteases	*Aspergillus oryzae*	10	1, 7

process/application	enzyme cost per unit quantity (US $)
starch liquefaction	ca. $ 2 per t starch
glucose from starch	$ 3.5 per t starch
isomerization of glucose	$ 6 per t starch
HFS in USA	$ 6–7 per t starch
ethanol	$ 1 per t starch
beer	$ 0.1 per 100 L
bakery goods USA	$ 0.1 per 100 kg flour
bakery goods EU	$ 0.1–0.5 per 100 kg flour
fruit juice	$ 0.1–0.5 per 100 L juice
wine	$ 0.1–0.5 per 100 L wine
stabilization of fruit lemonade by glucose oxidase	$ 0.3–0.8 per 1 000 L
cheese manufacture	$ 0.05 per 100 L milk
detergents	$ 0.05 per kg detergent
leather tanning	$ 1.2–3 per t skin

important goals in application technology

1. higher product quality
2. improved taste
3. better yields
4. reduced process costs
5. better filtration
6. better conservation
7. improved working conditions, reduced environmental load

Specific Proteins and/or Metabolic Pathways Can Be Improved and/or Manipulated By Recombinant DNA!



Metabolites Are Produced By Cellular Pathways That Use Specific Enzymes and Genes To Synthesize Specific Small Molecules

Non-fermentative pathways for synthesis of branched-chain higher alcohols as biofuels

Shota Atsumi[1], Taizo Hanai[1] & James C. Liao[1,2]

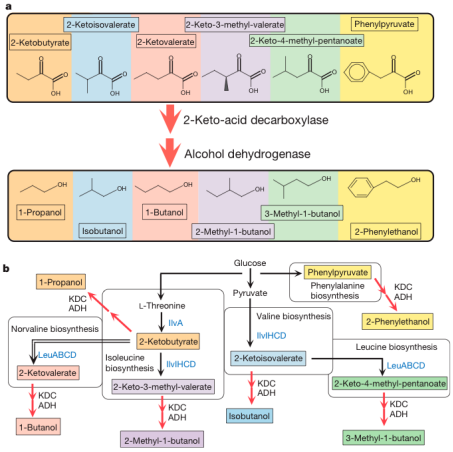

Figure 1 | Production of higher alcohols through the synthetic non-fermentative pathways. a, Various 2-keto acid precursors lead to corresponding alcohols through 2-ketoacid decarboxylase and alcohol dehydrogenase. **b**, The synthetic networks for the non-fermentative alcohol production in engineered *E. coli*. Red arrows represent the 2-keto acid decarboxylation and reduction pathway. Blue enzyme names represent amino acid biosynthesis pathways. The double lines represent a side pathway leading to norvaline and 1-butanol biosynthesis.

Bacteria Can Be Engineered To Degrade Biomass Waste-Containing Cellulose (e.g., paper)

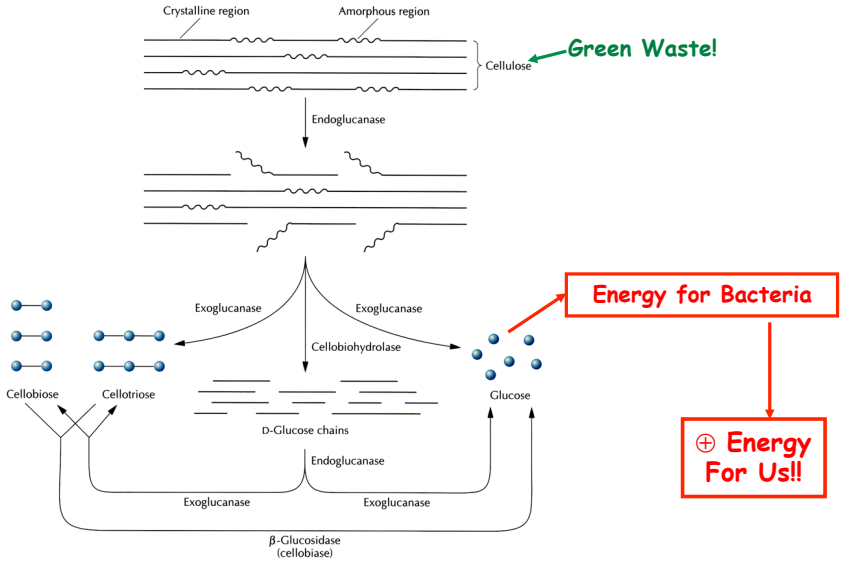

Figure 13.27 Enzymatic biodegradation of cellulose. Cellulose hydrolysis begins with the cleavage of β-1,4-linkages within the accessible amorphous regions of the cellulose chains by endoglucanase(s). This reaction is followed by the removal of oligosaccharides from the reducing ends of the partially cleaved cellulose chains by exoglucanase(s) and cellobiohydrolase(s). The degradation of cellulose is completed when the cellobiose and cellotriose are converted to glucose by β-glucosidase.

Agriculture, Timber Processing, Human Activities: e.g., Plants Left Over From Harvests, Animal Manure With Grasses, Municipal Water Paper, Cotton Leftovers, Hay, Etc.

Engineering *E.coli* To Synthesize Indigo- The Major Blue Dye For Jeans & Other Clothes & Uses

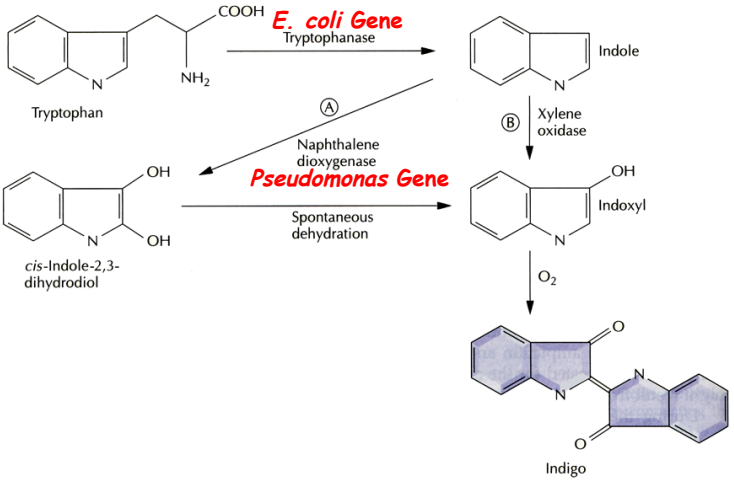

Figure 12.8 Indigo biosynthesis from tryptophan in genetically engineered *E. coli*. Tryptophanase is an *E. coli* enzyme. In pathway A, the naphthalene dioxygenase is derived from the NAH plasmid; in pathway B, the xylene oxidase is from the TOL plasmid. *E. coli* transformants that synthesize indigo contain either pathway A or B but not both pathways.

$200M/Year Industry

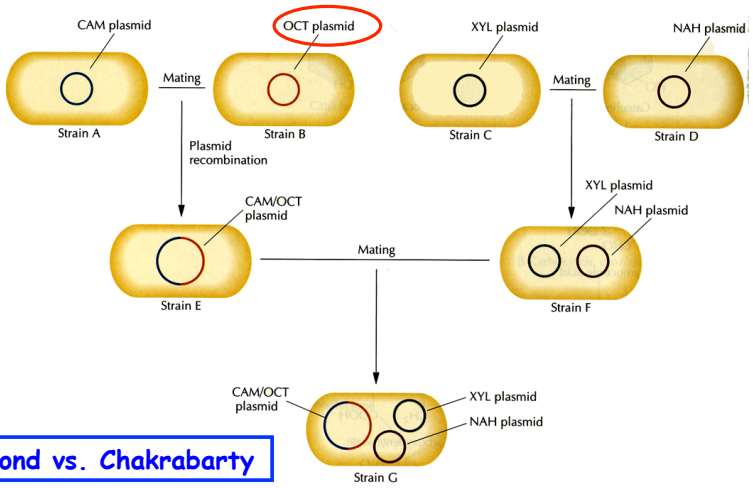
Bacteria Can Be Engineered To Degrade Several Different "Toxic" Compounds



Pseudomonas

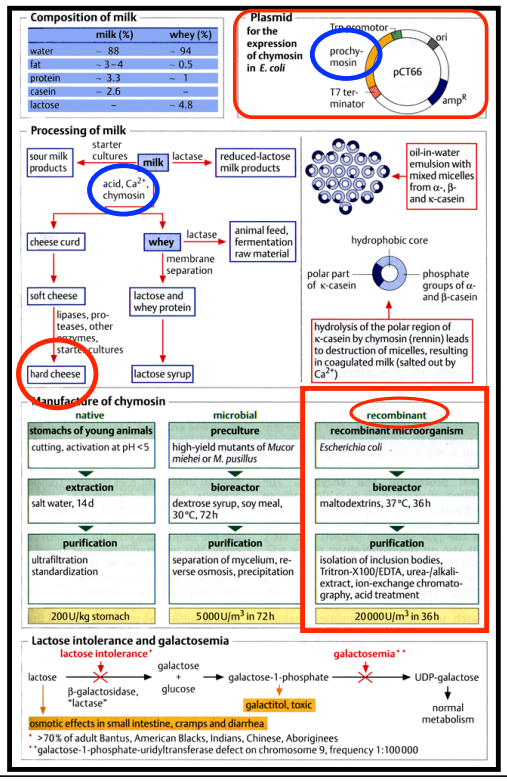
A Landmark Decision- Diamond vs. Chakrabarty

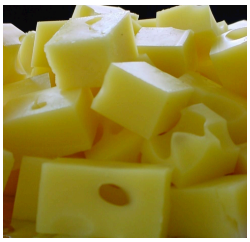
Chakrabarty US Patent 4,259,444 1981
Genetically Engineered Microorganisms Are "Inventions"

Life Can Be Patented !

Figure 13.5 Schematic representation of the development of a bacterial strain that can degrade camphor, octane, xylene, and naphthalene. Strain A, which contains a CAM (camphor-degrading) plasmid, is mated with strain B, which carries an OCT (octane-degrading) plasmid. Following plasmid transfer and homologous recombination between the two plasmids, strain E carries a CAM and OCT biodegradative fusion plasmid. Strain C, which contains a XYL (xylene-degrading) plasmid, is mated with strain D, which contains a NAH (naphthalene-degrading) plasmid, to form strain F, which carries both of these plasmids. Finally, strains E and F are mated to yield strain G, which carries the CAM/OCT fusion plasmid, the XYL plasmid, and the NAH plasmid.

Recombinant Chymosin Is Used To Make Cheese





Chymosin (Rennin) Acts On Milk Proteins To Coagulate Milk → Cheese

Is Cheese A GMO?

Chymosin In Cheese Making

1. ~80-90% of Cheeses Are Made With Recombinant Chymosin (a Protease)
2. Approved For Use In Cheese Making By FDA - 1992
3. Not Different From Non-Recombinant Chymosin- ∴ GRAS- Generally Regarded As Safe & No Labeling Needed — Because Not An Additive & Not Different From Non-Recombinant Chymosin!!

Is Cheese Made Using Recombinant Chymosin a GMO?

Industry Adds Claim That Recombinant Chymosin is "Kosher" & "Vegetarian"

Why No Fuss?

Guidance for Industry

FDA

Regulation of Mosquito-Related Products

II. BACKGROUND

Both FDA and EPA regulate products intended for use in or on animals. FDA is charged with protecting the public health by, among other things, ensuring that animal drugs are safe and effective [21 U.S.C. §393(b)(2)(B)]; under FIFRA, EPA is charged with protecting human health and the environment by ensuring registered pesticide products, when used according to the label directions, result in no unreasonable adverse effects to man or the environment. [7 U.S.C. § 136a(c)(5)].

A. New Animal Drugs

The FD&C Act defines the term "drug" as, among other things, "articles intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease in man or other animals" and "articles (other than food) intended to affect the structure or any function of the body of man or other animals." [21 U.S.C. §321(g)(1)]. With very limited exceptions for animal drugs that are generally recognized as safe and effective or are subject to a "grandfather" clause, the FD&C Act defines drugs that are intended for use for animals as "new animal drugs." As such, these drugs are subject to applicable pre-market approval and/or other review requirements. [21 U.S.C. §321(v); 21 U.S.C. §360b; 21 U.S.C. §360ccc; 21 U.S.C. §360ccc-1].

TABLE 2-1 Systematic Risk Assessment and Management

Step	Key questions
Hazard identification	What event posing harmful consequences could occur?
Risk analysis	How likely is the hazard?
	What would be the harms from realization of the hazard, and how severe are they, taking into account social values?
	What is the risk assessment as shown on a matrix of risk (likelihood of harm) plotted against severity of harm; see Figure 2-1, above)? Each cell of the matrix should be accompanied by a qualitative assessment of the response and a quantification of assurance needed to reduce harm if the cell's conditions were to occur.
	How well established is the knowledge used to identify the hazard, estimate its risk, and predict harms?
Risk reduction planning and implementation	What can be done (including bioconfinement and other confinement) to reduce risk, either by reducing the likelihood or mitigating the potential harms? Are there steps that can be taken to prepare for remediation?
Risk tracking (monitoring)	How effective are the implemented measures for risk reduction?
	Are they as good as, better than, or worse than planned?
	What follow-up, corrective action, or intervention will be pursued if findings are unacceptable?
	Did the intervention adequately resolve the concern?
Remedial action	What remedial action should be taken?
Transparency and public participation	How transparent should the entire process be? How much and what type of participation should there be in the steps above (and in risk characterization) by the public at large, by experts, and by interested and affected parties?

How To Assess Risk?

Gene-Engineered Mosquitoes Can't Spread Malaria: Researchers

by MAGGIE FOX

Researchers in California say they have genetically engineered mosquitoes that cannot be infected with the malaria parasite — and they've done it in a way that virtually guarantees the trait will spread quickly in a population.

Highly efficient Cas9-mediated gene drive for population modification of the malaria vector mosquito *Anopheles stephensi*

Advantages of Gene Editing Over "Cohen-Boyer" Genetic Engineering

- Simple Method to Edit, Correct, or Modify Any Endogenous Gene
- Multiple Genes Can Be Corrected at Once

Disadvantages of Gene Editing Over "Cohen-Boyer" Genetic Engineering

- Cannot Add Foreign Genes (e.g., GFP)
- Limited to Species-Specific Gene Corrections

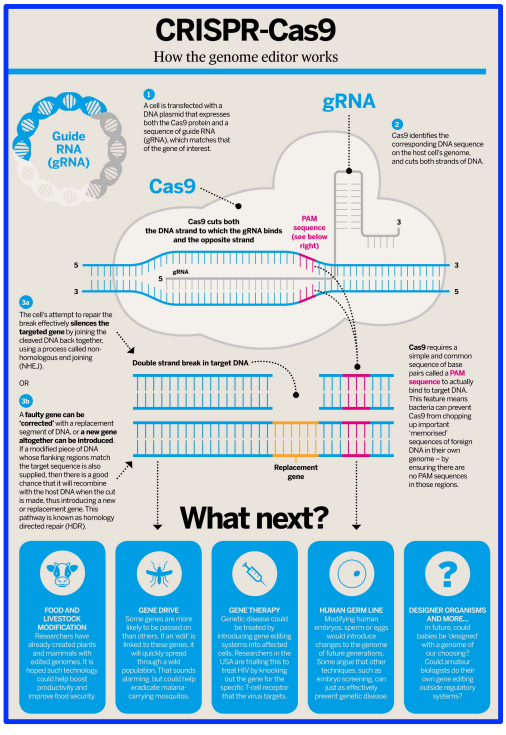
How Can Gene Editing Be Used in Genetic Engineering?



- Editing Crop Gene Genomes (e.g., drought resistance)
- Editing Farm Animals (e.g., pathogen resistance)
- Eliminating Mosquito Borne Diseases
- Correcting Human Genetic Defects – Gene Therapy
- Human Trait Enhancement

- Editing Alters Endogenous Genes Because Specific Targets Are Needed!
- Foreign Genes Are Not Added to the Genome!

Potential Gene Drive Applications

Public Health

Aedes aegypti
Image Source: US Centers for Disease Control and Prevention

- Control or alter organisms that carry infectious diseases that affect humans, such as dengue, malaria, Chagas, and Lyme disease
- Control or alter organisms that directly cause infection or disease, such as Schistosomiasis
- Control or alter organisms that serve as reservoirs of disease, such as bats and rodents

Ecosystem Conservation

Hemignathus munroi
('Akiapōlā'au honeycreeper)
Image Source: US Department of Fish and Wildlife Service

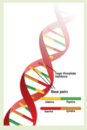
- Control or alter organisms that carry infectious diseases that threaten the survival of other species
- Eliminate invasive species that threaten native ecosystems and biodiversity
- Alter organisms that are threatened or endangered.

Agriculture

Fruit damage from spotted wing drosophila infestation
Image Source: US Department of Agriculture

- Control or alter organisms that damage or carry crop diseases
- Eliminate weedy plants that compete with cultivated crops

Basic Research



DNA Double Helix

Recommendations For Using Gene Drive Systems

- More Research Needs To Be Performed Before Gene Drive Modified Organisms Are Released Into The Environment
- Phased Testing of Gene Drive Modified Organisms From Laboratory to the Field Should Be Carried Out Under the Relevant Regulatory Oversight
- Robust Ecological Assessment Needs to be Carried Out Before Each Gene Drive Test Should Be Approved
- Public Engagement Must Be Built Into the Risk Assessment, and Policies Should Be Developed For How Public Engagement Will Factor Into Research sand Policy Decisions
- Current Regulatory Framework For Assessing Risks and Potential Environmental Impacts of Releasing Gene Drive Modified Organisms Are Inadequate. Regulations Does Not Fit Within Purview of USDA, EPA, or FDA
- There Are Regulatory Concerns About Biosafety, Biosecurity, and Potential for Misuse For Harmful Purposes

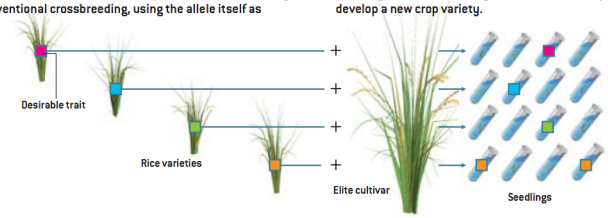
Using CRISPR-Cas9 Editing For Crop Improvement

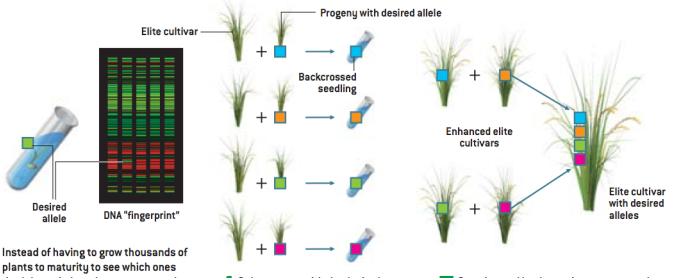
DESIGNING AND BUILDING NEW CROPS

When scientists know which gene controls a specific plant trait, such as seed size, they can search different varieties of the domesticated plant and its wild relatives to find a preferable version, or allele, of the gene. A breeder could then move a desirable allele from one plant into another through conventional crossbreeding, using the allele itself as a traceable marker for the trait. Instead of waiting a full growing season for plants to mature, the breeder could rapidly find out if seedlings have the desired trait by testing them for the allele in each round of breeding. Such marker-assisted breeding would dramatically shorten the time required to develop a new crop variety.



1 Each of four different rice varieties with a desirable trait can be crossed with an elite breeding line, or cultivar, to produce tens of thousands of seedlings.

2 Some, but not all, of the seedlings will inherit the desirable allele.



3 Instead of having to grow thousands of plants to maturity to see which ones inherited the trait, breeders can test each seedling's DNA for the desired allele just days after germination with the technology used for so-called DNA fingerprinting.

4 Only progeny with the desired alleles are grown until they are mature enough to breed with the elite cultivar, a step known as backcrossing.

5 Crossing and backcrossing are repeated, with the progeny's genes tested in every round, until all the desired alleles have been moved into the elite crop plant.

INTERNATIONAL SUMMIT ON HUMAN GENE EDITING

Recommendations For Using Human Gene Editing

- Basic & Preclinical Research on Human Gene Editing Should Proceed Subject To Appropriate Legal and Ethical Rules and Oversight
- Clinical Trials of Somatic Cell Gene Editing of Human Disease Genes Can Proceed Under Existing Gene Therapy Regulatory Frameworks
- Germline Editing of Human Genes Poses Many Important Issues (e.g.,Difficulty of Predicting Harmful Effects, Permanent Change in Human Gene Pool, Permanent Genetic Enhancements Causing Social Inequalities, Changing Human Evolution), and it Would Be Irresponsible To Proceed Clinically Until These Issues Are Resolved
- Need For International Standards and Norms Governing the Clinical Uses of Human Genome Editing Because There is One Human Genome Shared By All of Humanity
- Genome Editing For Purposes Other Than Treatment For Prevention of Human Disease Should Not Be Carried Out
